# Renormalization of twist-two operators and new 4-loop results for $N_{f}^{2}$ pure-singlet splitting functions 

Tong-Zhi Yang

with Thomas Gehrmann, Andreas von Manteuffel and Vasily Sotnikov Based on 2302.00022 [JHEP 04 (2023) 041] and a forthcoming paper

$$
\text { RADCOR 2023, Crieff Hydro Hotel, } 30 \text { May } 2023
$$

## Universität

Zürich ${ }^{\text {VZH }}$

Established by the European Commission

## Parton densities and splitting functions

- Bjorken variable

$$
x_{B}=\frac{-q^{2}}{2 P \cdot q}
$$

- Factorization

$$
\sigma \sim \sum_{a} f_{a \mid N}\left(x_{B}\right) \otimes \hat{\sigma}_{a}\left(x_{B}\right)
$$

- Quark parton density in axial gauge

$$
f_{q \mid N}\left(x_{B}\right)=\int \frac{d t}{2 \pi} e^{-i x_{B} t \Delta \cdot p}\langle N(P)| \bar{\psi}(t \Delta) \frac{\Delta}{2} \psi(0)|N(P)\rangle, \Delta^{2}=0
$$

- Splitting functions (SFs) govern the DGLAP evolutions of PDFs

$$
\frac{d f_{i \mid N}}{d \ln \mu}=2 \sum_{k} P_{i k} \otimes f_{k \mid N}
$$

## Why 4-loop SFs for the evolutions of N3LO PDFs?

- Expand PDFs and SFs with $a_{s}=\alpha_{s} /(4 \pi)$

$$
\begin{array}{r}
f_{i \mid N}=f_{i \mid N}^{(0)}+f_{i \mid N}^{(1)} a_{s}+\cdots+f_{i \mid N}^{(3)} a_{s}^{3}+\cdots \\
P_{i j}=P_{i j}^{(0)} a_{s}+\cdots+P_{i j}^{(3)} a_{s}^{4}+\cdots
\end{array}
$$

- Evolution of $a_{s}$

$$
\frac{d a_{s}}{d \ln \mu}=-2\left(a_{s}^{2} \beta_{0}+a_{s}^{3} \beta_{1}+\cdots\right)
$$

- A consistent evolution of N3LO PDFs requires 4-loop SFs

$$
f_{i \mid N}^{(3)} \frac{d a_{s}^{3}}{d \ln \mu}=f_{i \mid N}^{(3)}\left(-6 a_{s}^{4} \beta_{0}+\cdots\right)=\sum_{k} P_{i k}^{(3)} a_{s}^{4} \otimes f_{k \mid N}^{(0)}+\cdots
$$

## Motivations for four-loop splitting functions

- Several $\hat{\sigma}$ are available at N3LO, but N3LO PDFs are missing
- The fields in fitting N3LO PDFs are active
- MSHT20 aN3LO talks by Thomas Cridge,Lucian Harland-Lang from DIS2023
- NNPDF in progress towards aN3LO talk by Giacomo Magni from DIS2023
- CT are planning talk by Pavel Nadolsky from DIS2023

- Scale uncertainty at N3LO using NNLO PDF remains at $1 \%$ level[Chen, Gehrmann, Glover, Husss, Yang, Zhu, 2021]
- Seems that aN3LO PDF introduces large corrections to $\sigma$ talk by Tobias Neumman from DIS2023

## Splitting functions \& Anomalous dimensions

- Mellin transformation

$$
f_{q}(n)=-\int_{0}^{1} d x_{B} x_{B}^{n-1} f_{q}\left(x_{B}\right), \gamma_{i j}(n)=-\int_{0}^{1} d x_{B} x_{B}^{n-1} P_{i j}\left(x_{B}\right)
$$

- DGLAP evolution in $n$-space

$$
\frac{d}{d \ln \mu} f_{q}\left(n, \mu^{2}\right)=-2 \sum_{j} \gamma_{q j}(n) f_{j}\left(n, \mu^{2}\right)
$$

- PDFs in $n$-space are hadronic operator matrix elements (OMEs)

$$
f_{q}(n) \sim\langle N(P)| \bar{\psi} \Delta(\Delta \cdot D)^{n-1} \psi|N(P)\rangle
$$

## Twist-two operators

According to the flavor group,

- Non-singlet: a single operator

$$
O_{q, k}=\frac{i^{n-1}}{2}\left[\bar{\psi}_{i} \Delta(\Delta \cdot D)_{i j}^{n-1} \frac{\lambda_{k}}{2} \psi_{j}\right], k=3,8, \cdots n_{f}^{2}-1
$$

$\lambda_{k} / 2$ is the diagonal generator of the flavor group

- Singlet: two operators

$$
\begin{aligned}
O_{q} & =\frac{i^{n-1}}{2}\left[\bar{\psi}_{i} \not \Delta(\Delta \cdot D)_{i j}^{n-1} \psi_{j}\right] \\
O_{g} & =-\frac{i^{n-2}}{2}\left[\Delta_{\mu_{1}} G_{a, \mu}^{\mu_{1}}(\Delta \cdot D)_{a b}^{n-2} \Delta_{\mu_{n}} G_{b}^{\mu_{n} \mu}\right]
\end{aligned}
$$

$G_{a}^{\mu \nu}$ is the gluon field strength tensor.

## Renormalization of twist-two operators

- The non-singlet operator $O_{q, k}$ is multiplicatively renormalized,

$$
O_{q, k}^{\mathrm{R}}=Z^{\mathrm{ns}} O_{q, k}^{\mathrm{B}}
$$

- The two singlet operators mix under renormalization,

$$
\binom{O_{q}}{O_{g}}^{\mathrm{R}, \text { naive }}=\left(\begin{array}{cc}
Z_{q q} & Z_{q g} \\
Z_{g q} & Z_{g g}
\end{array}\right)\binom{O_{q}}{O_{g}}^{\mathrm{B}}
$$

- Evolution equation for the renormalization constants

$$
\frac{d Z_{i j}}{d \ln \mu}=-2 \sum_{k=q, g} \gamma_{i k}(n) Z_{k j}
$$

- Extract anomalous dimensions from the renormalization constants

$$
Z_{i j}=\delta_{i j}+\sum_{l=1}^{\infty} a_{s}^{l} \frac{1}{l \epsilon} \gamma_{i j}^{(k-1)}+\cdots
$$

## DIS method vs OME method

- Forward DIS (gauge invariant)

Shrinking the heavy lines into effective vertices

- Partonic off-shell OME (fewer diagrams, easier integrals)

1 diagram

3 diagrams

37 diagrams

684 diagrams

15901 diagrams

- Off-shell OMEs are not gauge invariant (due to off-shell external gluons), physical operators mix with unknown gauge-variant (GV) operators
- Main goal: find all GV operators or their Feynman rules

Once all GV operators are known, the off-shell OME method can be used to determine SFs efficiently

## A bit of history about the calculations of SFs

- The first one-loop results are from off-shell OMEs
- Non-singlet and singlet [D.J. Gross, F. Wilczek, 1973, 1974]
- Two-loop results
- Non-singlet from off-shell OMEs[E.G. Floratos et al. 1977]
- Singlet: inconsistences from off-shell OMEs in covariant gauge (Flaws due to omitting GV operators)[E.G. Floratos et al. 1978] and from off-shell OMEs in axial gauge (Correct) [Furmanski and Petronzio, 1980]
- The first three-loop results are from DIS
- Non-singlet and Singlet[Moch, Vermaseren and Vogt, 2004,2004]
- Partial four-loop results
- Non-singlet with $n \leq 16$ from off-shell OMEs[S. Moch et al. 2017]
- Singlet with $n \leq 8$ from DIS[S. Moch et al. 2021]
- Pure singlet with $n \leq 20$ from off-shell OMEs[G. Falcioni et al. 2023] see the talk by S . Moch

Only a few low- $n$ results at four-loop are available

## Significant efforts in deriving GV operators

- [D.J. Gross, F. Wilczek, 1974] pointed out possible mixing with GV operators
- [J.A. Dixon and J.C. Taylor, 1974] constructed order $g_{s}$ GV operators, not clear how to generalize to higher order
- [Joglekar and Lee, 1975] gave a general theorem about the renormalization of gauge invariant operators No explicit results were given
- [J. C. Collins and R. J. Scalise, 1994] studied the renormalization of energy-momentum tensor in detail and pointed out subtleties of theorem by Joglekar and Lee
- [G. Falcioni and F. Herzog, 2022] constructed the GV operators for a fixed $n$ based on a generalized BRST symmetry. Promising, however more and more number of operators are needed for higher $n$.
- This talk: A new framework which enables the derivation of all- $n$ GV operator (counterterm) Feynman rules to any loop orders

## A new framework of deriving GV operators

- Guiding principles:
- A twist-two operator has infinite mass dimension when $n \rightarrow \infty$
- Infinite GV operators are required to renormalize the physical operators
- Some GV operators only contribute starting at higher-loop order
- Extend the naive renormalization of the operator $O_{g}$,

$$
\begin{gathered}
O_{g}^{\mathrm{R}}=Z_{g q} O_{q}^{\mathrm{B}}+Z_{g g} O_{g}^{\mathrm{B}}+Z_{g A}\left(O_{A}^{\mathrm{B}}+O_{B}^{\mathrm{B}}+O_{C}^{\mathrm{B}}\right)+[Z O]_{g}^{\mathrm{GV}} \\
Z_{g A}=\mathcal{O}\left(a_{s}\right),[Z O]_{g}^{\mathrm{GV}}=\sum_{l=2}^{\infty} a_{s}^{l}[Z O]_{g}^{\mathrm{GV},(l)}
\end{gathered}
$$

- $O_{A}$ (gluon fields only), $O_{B}$ (quark+gluon fileds), $O_{C}$ (ghost + gluon fields). $[Z O]_{g}^{\mathrm{GV}}{ }^{(l)}$ : collection of counterterms

## Generalized mixing matrix

- The framework can be applied to the renormalization of $O_{q}$ directly

$$
O_{q}^{\mathrm{R}}=Z_{q q} O_{q}^{\mathrm{B}}+Z_{q g} O_{g}^{\mathrm{B}}+Z_{q A}\left(O_{A}^{\mathrm{B}}+O_{B}^{\mathrm{B}}+O_{C}^{\mathrm{B}}\right)+[Z O]_{q}^{\mathrm{GV}}
$$

where $Z_{q A}=\mathcal{O}\left(\alpha_{s}^{2}\right),[Z O]_{q}^{G V}=\mathcal{O}\left(\alpha_{s}^{3}\right)$

- Generalized mixing matrix

$$
\left(\begin{array}{c}
O_{q} \\
O_{g} \\
O_{A B C}
\end{array}\right)^{\mathrm{R}}=\left(\begin{array}{ccc}
Z_{q q} & Z_{q g} & Z_{q A} \\
Z_{g q} & Z_{g g} & Z_{g A} \\
0 & 0 & Z_{A A}
\end{array}\right)\left(\begin{array}{c}
O_{q} \\
O_{g} \\
O_{A B C}
\end{array}\right)^{\mathrm{B}}+\left(\begin{array}{c}
{[Z O]_{q}^{\mathrm{GV}}} \\
{[Z O]_{g}^{\mathrm{GV}}} \\
{[Z O]_{A}^{\mathrm{GV}}}
\end{array}\right)^{\mathrm{B}}
$$

- Where $O_{A B C}=O_{A}+O_{B}+O_{C}$
- The renormalizations of GV operators don't mix with physical operators, compatible with the theorems given by[Joglekar and Lee, 1975]

## Derive Feynman rules from off-shell OMEs

- Idea: derive Feynman rules instead of GV operators themselves
- Consider all off-shell OMEs with $2 j+m$-gluon external states

$$
\begin{aligned}
& \langle j| O_{g}^{\mathrm{R}}|j+m g\rangle_{1 \mathrm{PI}}^{\mu_{1} \cdots \mu_{m}}=\langle j|\left(Z_{g q} O_{q}^{\mathrm{B}}+Z_{g g} O_{g}^{\mathrm{B}}\right)|j+m g\rangle_{\mathrm{lPI}}^{\mu_{1} \cdots \mu_{m}} \\
& +\langle j| Z_{g A} O_{A B C}^{\mathrm{B}}|j+m g\rangle_{1 \mathrm{PI}}^{\mu_{1} \cdots \mu_{m}}+\langle j|[Z O]_{g}^{\mathrm{GV}}|j+m g\rangle_{1 \mathrm{PI}}^{\mu_{1} \cdots \mu_{m}}, j=q, g \text { or } \mathrm{c}
\end{aligned}
$$

- Expand OMEs order by order in loops and legs

$$
\langle j| O|j+m g\rangle^{\mu_{1} \cdots \mu_{m}}=\sum_{l=1}^{\infty}\left[\langle j| O|j+m g\rangle^{\mu_{1} \cdots \mu_{m},(l),(m)}\right]\left(\frac{\alpha_{s}}{4 \pi}\right)^{l} g_{s}^{m}
$$

- Left: UV renormalized and IR finite $\rightarrow$ no poles in $\epsilon$
- Right: Each term is UV divergent, but the sum should be finite
- Requirement of the finiteness allows to determine couterterm Feynman rules of unknown GV operators order by order

## Determine Feynman rules for $O_{A B C}$

- As an example, consider all off-shell two ghosts $+m$-gluon external states and expand to one-loop order

$$
Z_{g A}^{(1)}\langle c| O_{C}|c+m g\rangle_{1 \mathrm{PI}}^{\mu_{1} \cdots \mu_{m},(0),(m)}=-\left[\langle c| O_{g}|c+m g\rangle_{1 \mathrm{PI}}^{\mu_{1} \cdots \mu_{m},(1),(m), \mathrm{B}}\right]_{1 / \epsilon}
$$

- $Z_{g A}^{(1)}$ is a $m$-independent constant and can be determined from $m=0$

$$
Z_{g A}^{(1)}=\frac{-C_{A}}{\epsilon} \frac{1}{n(n-1)}
$$

Sample digram to extract Feynman rules for $O_{C}$ with $m=2$

## Determine Feynman rules for $[\mathrm{ZO}]_{g}^{\mathrm{GV},(2)}$

- As an example, consider all off-shell two ghosts $+m$-gluon external states and expand to two-loop order

$$
\begin{aligned}
& \langle c|[Z O]_{g}^{\mathrm{GV},(2)}|c+m g\rangle_{1 \mathrm{PI}}^{\mu_{1} \cdots \mu_{m},(0),(m)}=-\left\{\left[\langle c| O_{g}|c+m g\rangle_{1 \mathrm{PI}}^{\mu_{1} \cdots \mu_{m},(2),(m), \mathrm{B}}\right.\right. \\
& \quad+\left(Z_{c}^{(1)}+\frac{m Z_{g}^{(1)}}{2}+Z_{g g}^{(1)}-\frac{\beta_{0}(m+2)}{2 \epsilon}\right)\langle c| O_{g}|c+m g\rangle_{1 \mathrm{PI}}^{\mu_{1} \cdots \mu_{m},(1),(m), \mathrm{B}} \\
& \left.\left.\quad+Z_{g A}^{(1)}\langle c| O_{A C}|c+m g\rangle_{1 \mathrm{PI}}^{\mu_{1} \cdots \mu_{m},(1),(m), \mathrm{B}}+\cdots\right]_{\text {div }}\right\}
\end{aligned}
$$

Sample digrams to extract Feynman rules for $[Z O]_{g}^{\mathrm{GV},(2)}$ with $m=1$

## Three-loop singlet splitting functions from off-shell OMEs

## Sample Feynman diagrams

- Two-point diagrams with physical operators insertion

- Multi-point diagrams to infer GV counterterm Feynman rules

- Two-point diagrams with GV counterterm insertions

## Computational methods

- Non-standard terms appearing in the Feynman rules
- Example: Feynman rules for $O_{q}$ at lowest order

$$
\rightarrow \Delta\left(\Delta \cdot p_{1}\right)^{n-1}
$$

- Sum the non-standard term into a linear propagator using a tracing parameter $X$, first proposed in[J. Ablinger, J. Blumlein, A. Hasselhuhn, S. Klein, C. Schneider, and F. Wissbrock, 2012] See also the talk by J. Bluemlein

$$
(\Delta \cdot p)^{n-1} \rightarrow \sum_{n=1}^{\infty} x^{n}(\Delta \cdot p)^{n-1}=\frac{x}{1-x \Delta \cdot p}
$$

- Work in $x$-space throughout, take the coefficient of $x^{n}$ in the end using the package HarmonicSums[Ablinger 2010-].

## Computational procedure

- Generate all relevant Feynman diagrams: QGRAF
- Substitute the $x$-space Feynman rules: Mathematica
- Evaluate dirac matrix and color algebra: FORM and Color
- Classify the topologies: self-written code, Reduze 2, FeynCalc
- Perform IBP reductions: FIRE6 with LiteRed, Reduze 2, Kira
- Derive differential equations with respect to the parameter $x$
- Solve the DEs
- Two-point OMEs: in terms of special functions: the DEs are turned into canonical form proposed by Henn using CANONICA and Libra
- Multi-point OMEs: expand the DEs to high orders in $x \rightarrow 0$ limit and then reconstruct the final results based on heuristic ansatzs

## Sample results: Feynman rules for $O_{B}$

$$
\rightarrow-\frac{1+(-1)^{n}}{2} g_{s} \Delta^{\mu_{3}} T_{i_{2} i_{1}}^{a_{3}} \Delta\left(\Delta \cdot\left(p_{1}+p_{2}\right)\right)^{n-2}
$$

$$
\begin{aligned}
& \rightarrow \frac{1+(-1)^{n}}{-8} g_{s}^{2} \Delta^{\mu_{3}} \Delta^{\mu_{4}}\left(T^{a_{3}} T^{a_{4}}-T^{a_{4}} T^{a_{3}}\right)_{i_{2} i_{1}} \Delta \sum_{j_{1}=0}^{n-3}( \\
& 3\left(\Delta \cdot\left(p_{1}+p_{2}\right)\right)^{-j_{1}+n-3}\left[\left(-\Delta \cdot p_{3}\right)^{j_{1}}-\left(-\Delta \cdot p_{4}\right)^{j_{1}}\right] \\
& \left.-\left(-\Delta \cdot p_{4}\right)^{j_{1}}\left(\Delta \cdot p_{3}\right)^{-j_{1}+n-3}\right)
\end{aligned}
$$

Feynman rules for $O_{B}$ operator with all momenta flowing into the vertex

## Sample results for two-loop counterterm Feynman rules

$$
\begin{aligned}
\rightarrow & 2 i g_{s} C_{A}^{2} f^{a_{1} a_{2} a_{3}} \frac{1+(-1)^{n}}{256 n(n-1)} \frac{\left(\Delta \cdot p_{1}\right)^{n-2}}{\Delta \cdot p_{2}}\left(-\Delta^{\mu_{1}} \Delta^{\mu_{2}} \Delta^{\mu_{3}} \sum_{i=1}^{3} p_{i}^{2}\right. \\
& \left.+\Delta^{\mu_{2}} \Delta^{\mu_{3}} p_{1}^{\mu_{1}} \Delta \cdot p_{1}+\Delta^{\mu_{1}} \Delta^{\mu_{3}} p_{2}^{\mu_{2}} \Delta \cdot p_{2}+\Delta^{\mu_{1}} \Delta^{\mu_{2}} p_{3}^{\mu_{3}} \Delta \cdot p_{3}\right) \\
& \times\left\{\frac{F_{-2,0}+(1-\xi) F_{-2,1}}{\epsilon^{2}}+\frac{F_{-1,0}+(1-\xi) F_{-1,1}}{\epsilon}\right\}
\end{aligned}
$$

- $\epsilon$-dependent and $\xi$-dependent
- $F_{-1,0}$ contains generalized harmonic sums to weight-2, for example

$$
S_{1,1}\left(1, z_{1}+1 ; n\right)=\sum_{t_{1}=1}^{n} \frac{1}{t_{1}} \sum_{t_{2}=1}^{t_{1}} \frac{\left(1+z_{1}\right)^{t_{2}}}{t_{2}}
$$

- Weight-3 polylogarithms in $x$-space

## Two-point OMEs with two-loop counterterm insertions

- For a fixed $n$, normal IBP, but need to reduce integrals with very high numerator degree
- All- $n$, IBP reduction with polylogarithms?

- Consider a general term of two-loop counterterms with 3-gluon vertex

$$
i g_{s} f^{a_{1} a_{2} a_{3}} C_{A}^{2} \Delta^{\mu_{1}} \Delta^{\mu_{2}} \Delta^{\mu_{3}} p_{1}^{2} \sum_{m=0}^{n-3} a_{m n}\left(\Delta \cdot p_{1}\right)^{m}\left(\Delta \cdot p_{2}\right)^{n-3-m}+\cdots
$$

where $a_{m n}$ is known only for fixed $m, n$

- New idea: replace $a_{m n}$ by another tracing parameter $t$

$$
h(x, t)=\sum_{n=3}^{\infty} x^{n} \sum_{m=0}^{n-3} t^{m}\left(\Delta \cdot p_{1}\right)^{m}\left(\Delta \cdot p_{2}\right)^{n-3-m}=\frac{x^{3}}{\left(1-x t \Delta \cdot p_{1}\right)\left(1-x \Delta \cdot p_{2}\right)}
$$

- Insert $h$ into two-point diagrams: $\langle g| h(x, t)|g\rangle=\sum_{n=3}^{\infty} x^{n} \sum_{m=0}^{n-3} t^{m} c_{m n}$
- $\langle g| \sum_{m=0}^{n-3} a_{m n}\left(\Delta \cdot p_{1}\right)^{m}\left(\Delta \cdot p_{2}\right)^{n-3-m}|g\rangle=\sum_{m=0}^{n-3} a_{m n} c_{m n}$

Evaluate OMEs to any fixed $n$ efficiently and reconstruct the full- $n$ results

## Results

- Combine results for all two-point OMEs (with $O_{q}, O_{g}$ and GV counterterm insertions)
- Splitting functions: confirm the $\xi$-independence explicitly for the first time and recover the well known results in the literature
- non-singlet:

$$
\gamma_{\mathrm{ns}}^{(2)}-\gamma_{\mathrm{ns}}^{(2)}[\mathrm{MVV}]=0
$$

- singlet:

$$
\begin{aligned}
\gamma_{q q}^{(2)}-\gamma_{q q}^{(2)}[\mathrm{VMV}] & =0, \gamma_{q g}^{(2)}-\gamma_{q g}^{(2)}[\mathrm{VMV}]=0 \\
\gamma_{g q}^{(2)}-\gamma_{g q}^{(2)}[\mathrm{VMV}] & =0, \gamma_{g g}^{(2)}-\gamma_{g g}^{(2)}[\mathrm{VMV}]=0
\end{aligned}
$$

# Complete $N_{f}^{2}$ contributions to four-loop splitting functions in the $q \rightarrow q$ channel 

## Renormalization of $O_{q}$ to four loops in $q \rightarrow q$ channel

- Renormalization of two-point OMEs

$$
\begin{aligned}
&\langle q| O_{q}^{\mathrm{R}}|q\rangle= Z_{q q}\langle q| O_{q}^{\mathrm{B}}|q\rangle+Z_{q g}\langle q| O_{g}^{\mathrm{B}}|q\rangle \\
&+Z_{q A}\langle q| O_{A B C}^{\mathrm{B}}|q\rangle+\langle q|[Z O]_{q}^{\mathrm{GV}}|q\rangle \\
& Z_{q g}=\mathcal{O}\left(a_{s}\right), Z_{q A}=\mathcal{O}\left(a_{s}^{2}\right),[Z O]_{q}^{\mathrm{GV}}=\mathcal{O}\left(a_{s}^{3}\right)
\end{aligned}
$$

- $\langle\boldsymbol{q}|[Z O]_{q}^{\mathrm{GV}}|\boldsymbol{q}\rangle$ vanishes at the four-loop order
- Only $\langle\boldsymbol{q}|[Z O]_{q}^{\mathrm{GV},(4)}|\boldsymbol{q}\rangle^{(0)}$ and $\langle\boldsymbol{q}|[Z O]_{q}^{\mathrm{GV},(3)}|\boldsymbol{q}\rangle^{(1)}$ are relevant
- Other operators $\left(O_{q}, O_{g}, O_{A}, O_{B}\right)$ give all possible Lorentz structures of $q q, g g, q \bar{q} g$ vertex Feynman rules
$\bullet \rightarrow\langle q|[Z O]_{q}^{\mathrm{GV},(4)}|q\rangle^{(0)}=0,\langle g|[Z O]_{q}^{\mathrm{GV},(3)}|g\rangle^{(0)}=0$,

$$
\langle q|[Z O]_{q}^{\mathrm{GV},(3)}|q g\rangle^{(0)}=0
$$

## Sample Feynman diagrams

- OMEs with physical operator insertions

$\langle q| O_{q}^{\mathrm{B}}|\boldsymbol{q}\rangle^{(4)}$
$\langle q| O_{g}^{\mathrm{B}}|q\rangle^{(3)}$
- OMEs with GV operator or counterterm insertion

$$
\langle q| O_{B}^{\mathrm{B}}|q\rangle^{(2)}
$$

$$
\langle\boldsymbol{q}|[Z O]_{q}^{\mathrm{GV},(3)}|\boldsymbol{q}\rangle^{(1)}=0
$$

## Computations of the four-loop two-point OMEs

- Focus on $N_{f}^{2}$ part of $\langle q| O_{q}^{\mathrm{B}}|q\rangle$ at the four-loop order, i.e.
- Non-singlet: $N_{f}^{3} C_{F}, N_{f}^{2} C_{A} C_{F}, N_{f}^{2} C_{F}^{2}, N_{f}^{2}\left(d^{a b c}\right)^{2} / N_{c}$
- Pure-singlet: $N_{f}^{3} C_{F}, N_{f}^{2} C_{A} C_{F}, N_{f}^{2} C_{F}^{2}$
- Working in Feynman gauge with $\xi=1$
- IBP reductions and derivation of DEs in parameter- $x$ space
- Syzygy + finite-field sampling + denominator guessing + function reconstruction implemented in Finred by Andreas von Manteuffel
- All DEs can be turned into canonical form by CANONICA combined with Libra
- The solutions of DEs are in terms of HPLs up to weight 7
- HPLs[Remiddi and Vermaseren,1999] $\rightarrow$ Harmonic Sums[Vermaseren 1998,Blumlein and Kurth,1998]; For example

$$
H(1,1 ; x)=\sum_{n=1}^{\infty} x^{n}\left(-\frac{1}{n^{2}}+\frac{S(1, n)}{n}\right)
$$

## Results

- Managed to get $N_{f}^{2}$ contributions with all- $n$ dependence for both non-singlet and pure-singlet anomalous dimensions
- Non-singlet: HSs up to weight-5; Pure-singlet: HSs up to weight-4
- Non-singlet: cross-check against the previous results [Davies, Vogt, Ruijl, Ueda, Vermaseren, 16]
- Pure-singlet
- $N_{f}^{3}$ :

$$
\left.\gamma_{\mathrm{ps}}^{(3)}\right|_{N_{f}^{3}}-\left.\gamma_{\mathrm{ps}}^{(3)}\right|_{N_{f}^{3}}[\text { DVRUV }]=0
$$

- $N_{f}^{2}$ : the all- $n$ results are new; Agree with the previous fixed $n$ results [Falcioni, Herzog, Moch, Vogt, 23]
- Sample fixed n results with $n=1000$

$$
\left.\gamma_{\mathrm{ps}}^{(3)}\right|_{n=1000}=-0.000160574 C_{F} N_{f}^{3}-0.000723846 C_{A} C_{F} N_{f}^{2}+0.00116302 C_{F}^{2} N_{f}^{2}
$$

- Our all- $n$ results allow to derive the small- $x_{B}$ limit easily

## Summary

- Renormalization of physical operators require unknown GV operators
- Developed a new framework to infer splitting functions
- Two-point OMEs are used to extract splitting functions
- Multi-point $(\geq 3)$ OMEs are required to determine counterterm Feynman rules of the GV operators
- Applied it to derive 3-loop singlet splitting functions and recovered the well known results in the literature (first in general covariant gauge)
- Obtained for the first time the complete $N_{f}^{2}$ contributions to four-loop pure-singlet anomalous dimensions with all- $n$ dependence

| Loops Legs | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: |
| 0 |  | $[Z O]_{g}^{\mathrm{GV},(2)} \mid$ | $O_{A B C} \uparrow$ | $O_{q}, O_{g}$ |
| 1 | $[Z O]_{g}^{\mathrm{GV},(2)}$ | $O_{A B C}$ | $O_{g}$ |  |
| 2 | $O_{A B C}$ | $O_{g}$ |  |  |
| 3 | $O_{q}, O_{g}$ |  |  |  |
| 4 | $\langle q\| O_{q}\|q\rangle N_{f}^{2}$ |  |  |  |

## Decomposition of splitting functions

- The general structure of quark splitting functions,

$$
P_{q_{i} q_{k}}=\delta_{i k} P_{q q}^{V}+P_{q q}^{S}, \quad P_{q_{i} \bar{q}_{k}}=\delta_{i k} P_{q \bar{q}}^{V}+P_{q \bar{q}}^{S}
$$

- Non-singlet and singlet splitting functions

$$
\text { Non-singlet: } P_{\mathrm{ns}}^{ \pm}=P_{q q}^{V} \pm P_{q \bar{q}}^{V}, \quad P_{\mathrm{ns}}^{V}=P^{-}+\overbrace{n_{f}\left(P_{q q}^{S}-P_{q \bar{q}}^{S}\right)}
$$

Singlet: $P_{q q}=P^{+}+\underbrace{n_{f}\left(P_{q q}^{S}+P_{q \bar{q}}^{S}\right)}_{P_{p s}}, P_{q g}, P_{g q}, P_{g g}$

- Evolution of PDFs

$$
\begin{aligned}
& \frac{d T_{i}^{ \pm}}{d \ln \mu}=2 P_{\mathrm{ns}}^{ \pm} \otimes T_{i}^{ \pm}, \frac{d \sum_{k=1}^{n_{f}} q_{k}^{-}}{d \ln \mu}=2 P_{\mathrm{ns}}^{V} \otimes \sum_{k=1}^{n_{f}} q_{k}^{-}, i=3,8, \cdots n_{f}^{2}-1 \\
& T_{3}^{ \pm}=u^{ \pm}-d^{ \pm}, T_{8}^{ \pm}=u^{ \pm}+d^{ \pm}-2 s^{ \pm}, \cdots, q_{k}^{ \pm}=q_{k} \pm \bar{q}_{k} \\

\end{aligned}
$$

## Lorentz structures of a twist-two operator

- Based on the following two properties
- A twist-two operator has spin- $n$ and mass dimension $n+2$
- Propagator-type Feynman rules like $1 / p^{2}$ can not appear in a vertex
- A twist-2 operator involving quarks or ghosts has one Lorentz structure only

$$
\langle q| O|q+m g\rangle_{1 \mathrm{PI}}^{\mu_{1} \cdots \mu_{m},(0),(m)}=c_{m} \Delta^{\mu_{1}} \cdots \Delta^{\mu_{m}}
$$

- A twist-two operator involving only gluons
- Only $1+3 / 2 m(m-1)$ Lorentz structures for $m$-gluon Feynman rules
- $m=$ 3: $a_{1} \Delta^{\mu_{1}} \Delta^{\mu_{2}} \Delta^{\mu_{3}}+a_{2} \Delta^{\mu_{1}} \Delta^{\mu_{2}} p_{1}^{\mu_{3}}+\cdots+a_{10} \Delta^{\mu_{3}} g^{\mu_{1} \mu_{2}}$
- 19 for $m=4$ and 31 for $m=5$
- Count the mass dimension of $a_{i}:\left[a_{i}\right]=x_{i}\left[\Delta \cdot p_{j}\right]+y_{i}\left[p_{j} \cdot p_{k}\right]\left(y_{i} \geq 0\right)$ $\left[a_{1}\right]=n-3+y_{1}\left[p_{j} \cdot p_{k}\right]=n+2-3 \rightarrow y_{1}=1\left(\right.$ Linear in $\left.p_{1}^{2}, p_{1} \cdot p_{2} \cdots\right)$ $\left[a_{2}\right]+\left[p_{1}^{\mu_{3}}\right]=n-2+y_{2}\left[p_{j} \cdot p_{k}\right]+1=n+2-3 \rightarrow y_{2}=0$
- Why not $a_{11} \Delta^{\mu_{1}} p_{1}^{\mu_{2}} p_{2}^{\mu_{3}}$

$$
\left[a_{11}\right]+2+3 \geq n-1+y_{11}\left[p_{j} \cdot p_{k}\right]+2+3=n+4\left(\text { if } y_{11}=0\right)
$$

where 3 is mass dimension of the external 3 gluons. Twist-4 operators

## Computations of single pole for one-loop multi-leg OMEs

- Set all Mandelstam variables $p_{1}^{2}, p_{2}^{2} \ldots$ to numerical numbers and reconstruct their linear dependence

- Only two types of integrals are needed, other integrals are finite

$$
I_{1}=\int \frac{d^{d} l}{i \pi^{d / 2}} \frac{1}{\left(l-q_{1}\right)^{2} l^{2}}, \quad I_{2}=\int \frac{d^{d} l}{i \pi^{d / 2}} \frac{1}{\left(l-q_{1}\right)^{2} l^{2}\left(1-x \Delta \cdot\left(l+q_{2}\right)\right)}
$$

- At most $x$-dependent logarithms appear in the single pole

$$
I_{2}=\frac{1}{\epsilon}\left[\frac{\ln \left(1-x \Delta \cdot q_{1}-x \Delta \cdot q_{2}\right)-\ln \left(1-x \Delta \cdot q_{2}\right)}{-x \Delta \cdot q_{1}}\right]+\mathcal{O}\left(\epsilon^{0}\right)
$$

- Logarithms in $x$-space $\rightarrow n$-space

$$
\ln \left(1-x \Delta \cdot p_{1}-x \Delta \cdot p_{2}\right)=\sum_{n=1}^{\infty} x^{n}\left[\frac{-1}{n}\left(\Delta \cdot p_{1}+\Delta \cdot p_{2}\right)^{n}\right]
$$

- Factoring out the overall factor $Z_{g A}^{(1)}=-\frac{C_{A}}{\epsilon} \frac{1}{n(n-1)}$

## Computations of two-loop three-leg OMEs

- Set all Mandelstam variables $p_{1}^{2}, p_{2}^{2} \ldots$ to numerical numbers and

$$
\Delta \cdot p_{1}=1, \Delta \cdot p_{2}=z_{1}
$$

- Derive DE with respect to $x$
- Difficult to solve DE in terms of special functions
- Expand DE to $x^{100}$ in the limit of $x \rightarrow 0$, with the boundary conditions being two-loop three-leg integrals without operator insertions[T. G. Birthwright, E. W. N. Glover, and P. Marquard, 04]

## Reconstruct two-loop counterterm Feynman rules

- Obtain two-loop three-leg OMEs to $x^{96}$ or $n=96$
- For a fixed $n$, the result is a polynomial in $z_{1}$
- Construct full- $x$ or full- $n$ results from data to $n=76$ based on ansatz
- Polylogarithms to weight-3, generalized Harmonic sums to weight-2

$$
\begin{aligned}
G\left(1,1,1 /\left(1+z_{1}\right) ; x\right)=\sum_{n=1}^{\infty} & x^{n}
\end{aligned} \begin{array}{r}
{\left[\frac{S_{1}\left(z_{1}+1 ; n\right)}{n^{2}}+\frac{S_{2}\left(z_{1}+1 ; n\right)}{n}\right.} \\
\\
\left.-\frac{S_{1,1}\left(1, z_{1}+1 ; n\right)}{n}-\frac{\left(z_{1}+1\right)^{n}}{n^{3}}\right]
\end{array}
$$

where $S_{1,1}\left(1, z_{1}+1 ; n\right)=\sum_{t_{1}=1}^{n} \frac{1}{t_{1}} \sum_{t_{2}=1}^{t_{1}} \frac{\left(1+z_{1}\right)^{t_{2}}}{t_{2}}$

- Due to the generalized Harmonic sums, impossible to disentangle
- renormalization constants (no $z_{1}$ dependence)
- operator Feynman rules (no high-weight ( $\geq 1$ ) functions)

A counterterm Feynman rule \& infinite operator Feynman rules $\left(N_{2}=\infty\right)$
