RADCOR 2023

# QED at NNLO and beyond for precision experiments

Yannick Ulrich

IPPP, University of Durham

1 JUNE 2023

## $g - 2$ and the MUonE experiment ( $\rightarrow$ Marco's talk)

- luminosity measurements  $\Rightarrow e^+e^- \rightarrow e^+e^-$  (Belle, FCC-ee, ...)  
[Banerjee, Engel, Schalch, Signer, YU 21]
- dark sector searches  $\Rightarrow e^+e^- \rightarrow \gamma\gamma$  (PADME, also for luminosity...)  
[Engel, Naterop, Signer, YU, Zoller 2?]
- $R$  ratios  $\Rightarrow e^+e^- \rightarrow$  stuff (DAΦNE, CMD3, ...)
- $\tau$  physics  $\Rightarrow e^+e^- \rightarrow \tau^+\tau^-$  (Belle) [Kollatzsch, YU 22]
- proton radius  $\Rightarrow \ell p \rightarrow \ell p$  and  $ee \rightarrow ee$  (P2, PRad, MUSE)  
[Bucoveanu, Spiesberger 18; Banerjee, Engel, Signer, YU 20; Banerjee, Engel, Schalch, Signer, YU 21]
- lepton decays  $\Rightarrow \ell \rightarrow \ell' \nu \bar{\nu} + \{ee, \gamma, \gamma\gamma\}$  (MEG, Mu3e, Belle, ...)  
[Pruna, Signer, YU 16; YU, 17; Engel, Gnendiger, Signer, YU, 18, Banerjee, Coutinho, Engel, Gurgone, Signer, YU 22]

QCD @ LHC	$\Leftrightarrow$	QED @ low & medium energy	
non-abelian	$\gtrsim$	abelian	matrix elements somewhat easier
non-abelian	$\gg$	abelian	IR structure <b>much easier</b> ①
massless fermions	$\ll$	massive fermions	loop amplitudes <b>much harder</b> ②
jets	$<$	exclusive w.r.t. collinear radiation	numerics <b>harder</b> $\supset \log(m^2/Q^2) \equiv L$ <b>much harder</b> for small masses ③

### stealing from QCD

- master integrals (reduction and computation), automated tools, EFT methods
- use dimensional regularisation for IR singularities, not photon mass
- use subtraction method for phase-space integration, not slicing method
- for the future: match fixed-order result to parton shower

soft singularities exponentiate [Yennie, Frautschi, Suura 61]

- universal soft limit  $\mathcal{M}_{n+1}^{(\ell)} = \mathcal{E}\mathcal{M}_n^{(\ell)} + \mathcal{O}(E_\gamma^{-1})$
- universal pole structure  $e^{\hat{\mathcal{E}}} \sum_{\ell=0}^{\infty} \mathcal{M}_n^{(\ell)} = \sum_{\ell=0}^{\infty} \mathcal{M}_n^{(\ell)f} = \text{finite}$

use this to construct an all-order subtraction scheme FKS<sup>ℓ</sup>

- nothing complicated needed higher than  $\mathcal{O}(\epsilon^0)$
- only one universal CT:  $\hat{\mathcal{E}}$

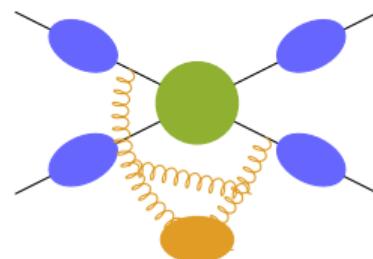

$$\underbrace{\int d\Phi_\gamma \text{ (diagram with grey blob)}}_{\text{divergent and complicated}} = \underbrace{\int d\Phi_\gamma \left( \text{ (diagram with grey blob)} - \text{ (diagram with green blob)} \right)}_{\text{complicated but finite}} + \underbrace{\int d\Phi_\gamma \text{ (diagram with green blob)}}_{\text{divergent but easy}}$$

masses are physical in QED  $\Rightarrow$  keep masses

- drop polynomially suppressed terms at two-loop  $\rightarrow$  error  $\sim \left(\frac{\alpha}{\pi}\right)^2 \log \frac{m^2}{Q^2} \times \frac{m^2}{Q^2}$
- based on factorisation, SCET, and method of regions  
[Penin 06; Becher, Melnikov 07; Engel, Gnendiger, Signer, YU 18]
- process e.g.  $ee \rightarrow ee$  at two-loop:

$$\mathcal{A}(m) = \mathcal{S} \times \sqrt{Z} \times \sqrt{Z} \times \sqrt{Z} \times \sqrt{Z} \times \mathcal{A}(0) + \mathcal{O}(m) \supset \{1/\epsilon^2, L^2\}$$

- soft: process-dependent  $S = 1 + \text{fermion loops}$   
 $\rightarrow$  compute separately anyway to combine with hadron loops
- collinear: universal  $Z$ , converts  $1/\epsilon \rightarrow \log(m^2/Q^2)$
- hard: massless calculation

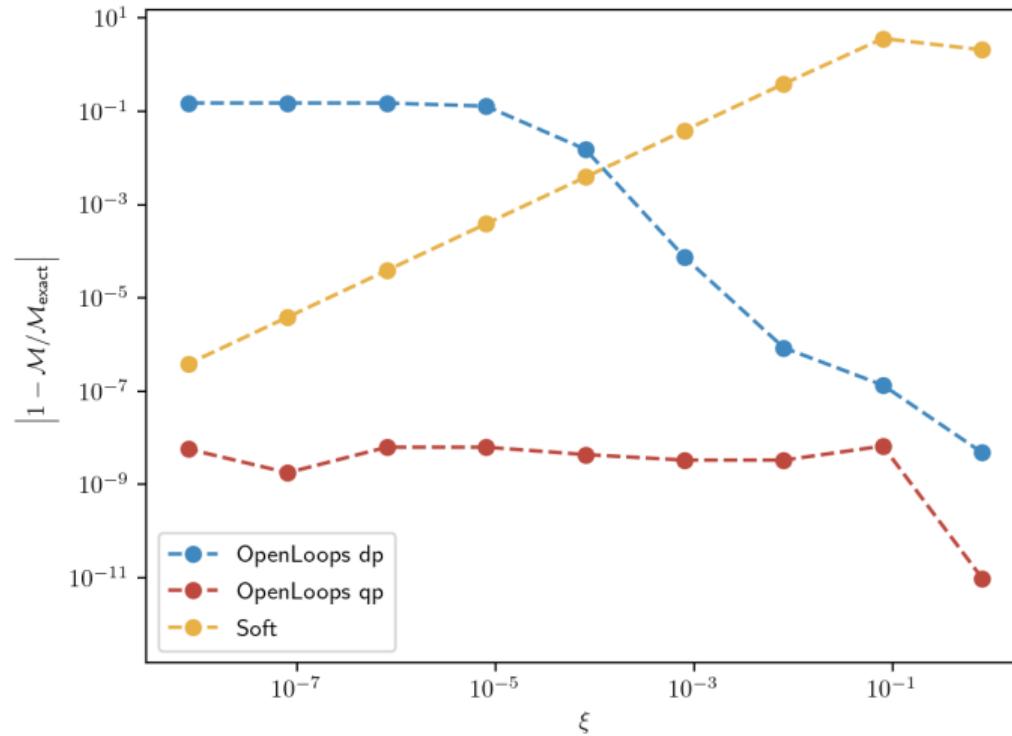

real-virtual (or even real-real-virtual)

$$\mathcal{M}_{n+1}^{(\ell)} \sim \frac{1}{E_\gamma^2(1-\beta \cos \theta)}$$

- ‘trivial’ in principle [Buccioni, Pozzorini, Zoller 18; Buccioni, Lang, Lindert, Maierhöfer, Pozzorini et al. 19]
  - extremely delicate numerically for  $E_\gamma \rightarrow 0$  (or  $\cos \theta \rightarrow 1$ )
- ⇒ Taylor expand around  $E_\gamma = 0$  if small

$$\begin{array}{c} \text{Diagram of a virtual particle exchange between two external lines} \\ \text{with a shaded loop and a wavy line above it.} \end{array} = \frac{1}{E_\gamma^2} \mathcal{E} \underbrace{\begin{array}{c} \text{Diagram of a virtual particle exchange between two external lines} \\ \text{with a green shaded loop and a wavy line above it.} \end{array}}_{\text{eikonal}} + \mathcal{O}(E_\gamma^{-1})$$

example  $e^+e^- \rightarrow e^+e^-\gamma$  @ one-loop

compare with exact calculation in Mathematica  
[Banerjee, Engel, Schalch, Signer, YU 21]

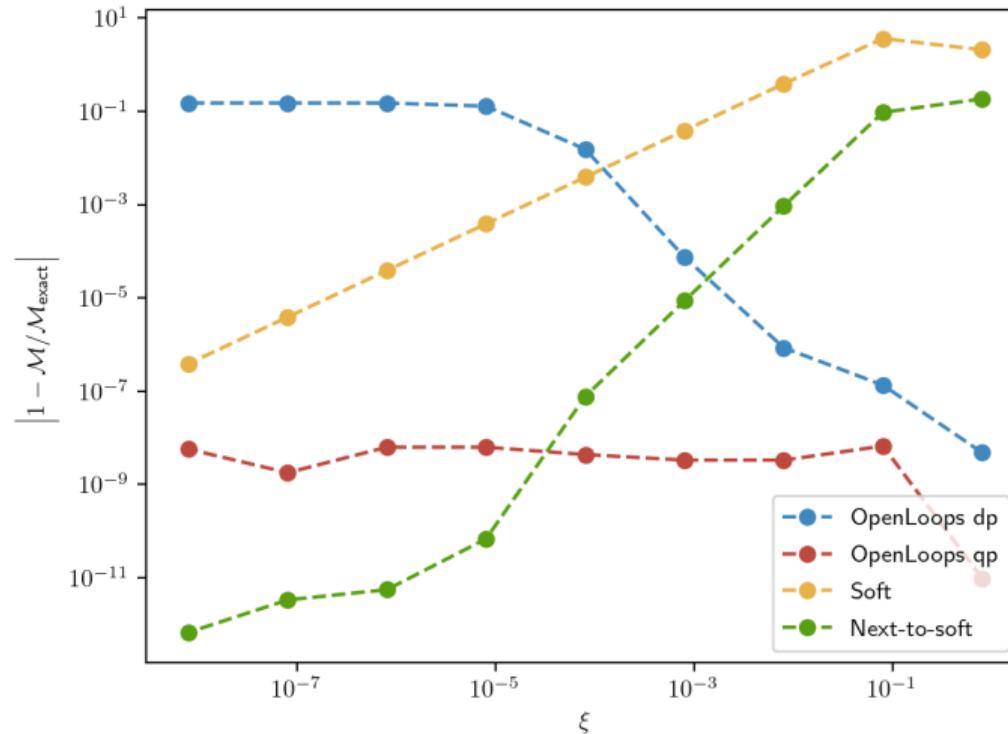

real-virtual (or even real-real-virtual)

$$\mathcal{M}_{n+1}^{(\ell)} \sim \frac{1}{E_\gamma^2(1-\beta \cos \theta)}$$

- ‘trivial’ in principle [Buccioni, Pozzorini, Zoller 18; Buccioni, Lang, Lindert, Maierhöfer, Pozzorini et al. 19]
  - extremely delicate numerically for  $E_\gamma \rightarrow 0$  (or  $\cos \theta \rightarrow 1$ )
- ⇒ Taylor expand around  $E_\gamma = 0$  if small
- LBK theorem [Low 58; Burnett, Kroll 67] and extension [Engel, Signer, YU 21; Kollatzsch, YU 22; Engel 23]

$$\begin{aligned}
 & \text{Diagram showing the expansion of a real-virtual loop diagram:} \\
 & \text{The main term is } \frac{1}{E_\gamma^2} \mathcal{E} \text{ (eikonal).} \\
 & \text{The next terms are:} \\
 & \quad \frac{1}{E_\gamma} \left\{ D \text{ (LBK)} + S \text{ (soft function)} + \partial_P \left[ \text{eikonal} + \text{soft function} \right] + P \text{ (polarisation effects)} \right\} \\
 & \quad + \mathcal{O}(E_\gamma^0)
 \end{aligned}$$

example  $e^+e^- \rightarrow e^+e^-\gamma$  @ one-loop

compare with exact calculation in Mathematica  
[Banerjee, Engel, Schalch, Signer, YU 21]

## a few more hurdles

- VP diagrams for  $e/\mu/\tau/\text{had}/\dots$  numerically with full mass dependence

$$\begin{array}{c} \text{---} \\ | \\ \text{---} \end{array} = \int dQ^2 \Pi(Q^2) K(Q^2, s, t)$$

- collinear pseudo-singularities  $\lim_{\gamma \rightarrow 0} \Delta(p_\gamma, p_i) \Rightarrow L$
  - phase-space tuning s.t.  $\cos \Delta \sim x_i$
- $\Rightarrow$  at most one small angle  $\rightarrow$  FKS partitioning

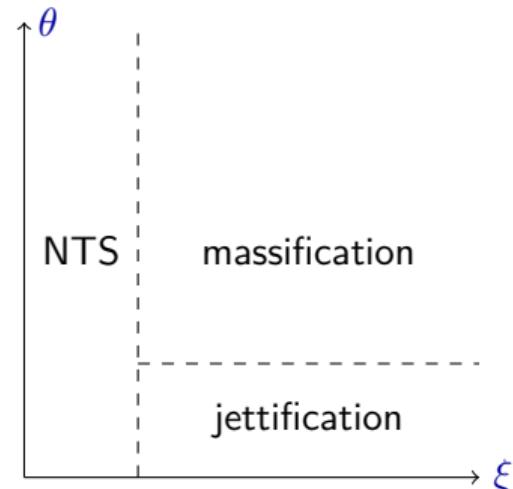

[Signer 22]

$ee \rightarrow \gamma^*$  can be taken to N<sup>3</sup> LO

- VVV: known  
[Fael, Lange, Schönwald, Steinhauser 22]
  - RRR: “trivial”
  - RRV: OpenLoops + NTS stabilisation
  - RVV
    - massless [Bader, Kryś, Moodie, Zoia 2?] implemented, running at  $\sim 130\text{ev/s}$
    - maybe DiffExp
- ⇒ LBK + jettification at two-loop

jettification

- expand for small emission angles

the NNLO era is here, not only for QCD, also for QED

### future steps

- NNLO QED $\oplus$  EW
- NNLO QED $\oplus$  PS
- higher energies
- massification for real corrections
- collinear stabilisation
- $N^3$  LO for  $\gamma^* \rightarrow ll$   
 $\Rightarrow$  Workstop in Durham
