Method of Regions (MoR)

Hidden regions due to cancellation

Integrals with Pinch Singularities

Finding and evaluating integrals with pinch singularities for generic kinematics

MoR and Hidden Regions due to Cancellation

On-Shell & Forward Scattering

Evaluating Integrals in the Minkowski Regime w/o Contour Deformation

Concept

Massless & massive examples

Introduction

Parameter Space

Can exchange integrals over loop momenta for integrals over parameters

Feynman Parametrisation

$$\begin{bmatrix} d\alpha \end{bmatrix} = \prod_{e \in G} \frac{d\alpha_e}{\alpha_e} \quad \alpha^{\nu} = \prod_{e \in G} \alpha_e^{\nu_e}$$

$$I(s) = \frac{\Gamma(\nu - LD/2)}{\prod_{e \in G} \Gamma(\nu_e)} \int_0^\infty \begin{bmatrix} d\alpha \end{bmatrix} \alpha^{\nu} \delta\left(1 - H(\alpha)\right) \frac{\left[\mathcal{U}(\alpha)\right]^{\nu - (L+1)D/2}}{\left[\mathcal{F}(\alpha; s)\right]^{\nu - LD/2}}$$

 \mathcal{U}, \mathcal{F} homogeneous polynomials of degree L and L+1

Lee-Pomeransky Parametrisation

$$I(s) = \frac{\Gamma(D/2)}{\Gamma\left((L+1)D/2 - \nu\right)\prod_{e \in G} \Gamma(\nu_e)} \int_0^\infty \left[dx\right] x^{\nu} \left(\mathscr{G}(\mathbf{x}, s)\right)^{-D/2}$$
$$\mathscr{G}(\mathbf{x}; s) = \mathscr{U}(\mathbf{x}) + \mathscr{F}(\mathbf{x}; s)$$

Lee, Pomeransky 13

Sector Decomposition in a Nutshell

$$I \sim \int_{\mathbb{R}^{N+1}_{\geq 0}} \left[\mathrm{d}x \right] x^{\nu} \frac{[\mathcal{U}(x)]^{N-(L+1)D/2}}{[\mathcal{F}(x,\mathbf{s}) - i\delta]^{N-LD/2}} \,\delta(1 - H(x))$$

Singularities

- 1. UV/IR singularities when some $x \rightarrow 0$ simultaneously \implies Sector Decomposition
- 2. Thresholds when \mathscr{F} vanishes inside integration region \Longrightarrow Contour Deformation

Sector decomposition

Find a local change of coordinates for each singularity that factorises it (blow-up)

Sector Decomposition in a Nutshell

$$I \sim \int_{\mathbb{R}_{\geq 0}^{N}} \left[\mathrm{d}\mathbf{x} \right] \mathbf{x}^{\nu} \left(c_{i} \, \mathbf{x}^{\mathbf{r}_{i}} \right)^{t}$$
$$\mathcal{N}(I) = \mathrm{convHull}(\mathbf{r}_{1}, \mathbf{r}_{2}, \ldots) = \bigcap_{f \in F} \left\{ \mathbf{m} \in \mathbb{R}^{N} \mid \langle \mathbf{m}, \mathbf{n}_{f} \rangle + a_{f} \geq 0 \right\}$$

Normal vectors incident to each extremal vertex define a local change of variables* Kaneko, Ueda 10

$$\begin{aligned} x_i &= \prod_{f \in S_j} y_f^{\langle \mathbf{n}_f, \mathbf{e}_i \rangle} \\ I &\sim \sum_{\sigma \in \Delta_{\mathcal{N}}^T} |\sigma| \int_0^1 \left[\mathrm{d} \mathbf{y}_f \right] \prod_{f \in \sigma} y_f^{\langle \mathbf{n}_f, \nu \rangle - ta_f} \left(c_i \prod_{f \in \sigma} y_f^{\langle \mathbf{n}_f, \mathbf{r}_i \rangle + a_f} \right)^t \\ & \overline{\text{Singularities}} \quad \overline{\text{Finite}} \end{aligned}$$

*If $|S_j| > N$, need triangulation to define variables (simplicial normal cones $\sigma \in \Delta_{\mathcal{N}}^T$)

Method of Regions

Consider expanding an integral about some limit: $p_i^2 \sim \lambda Q^2$, $p_i \cdot p_j \rightarrow \lambda Q^2$ or $m^2 \sim \lambda Q^2$ for $\lambda \rightarrow 0$

Issue: integration and series expansion do not necessarily commute

Method of Regions

$$I(\mathbf{s}) = \sum_{R} I^{(R)}(\mathbf{s}) = \sum_{R} T_{\mathbf{t}}^{(R)} I(\mathbf{s})$$

- 1. Split integrand up into regions (R)
- 2. Series expand each region in λ
- 3. Integrate each expansion over the whole integration domain
- 4. Discard scaleless integrals (= 0 in dimensional regularisation)
- 5. Sum over all regions

Smirnov 91; Beneke, Smirnov 97; Smirnov, Rakhmetov 99; Pak, Smirnov 11; Jantzen 2011; ...

Finding Regions

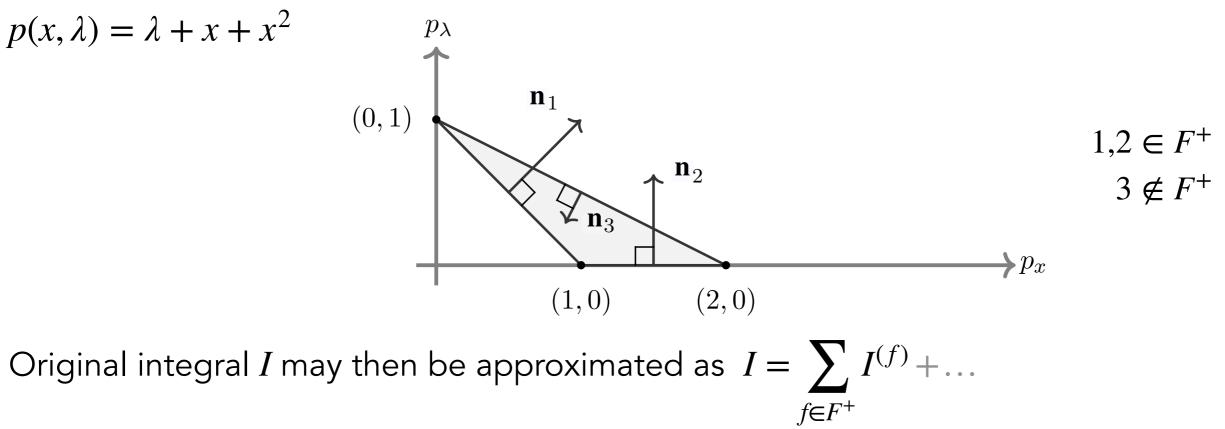

Assuming all c_i have the same sign we rescale $s \to \lambda^{\omega} s$ $I \sim \int_{\mathbb{R}^N_{\geq 0}} \left[\mathrm{d}x \right] x^{\nu} \left(c_i x^{\mathbf{r}_i} \right)^t \to \int_{\mathbb{R}^N_{\geq 0}} \left[\mathrm{d}x \right] x^{\nu} \left(c_i x^{\mathbf{r}_i \lambda^{r_{i,N+1}}} \right)^t \to \mathcal{N}^{N+1}$

Normal vectors w/ positive λ component define change of variables $\mathbf{n}_f = (v_1, \dots, v_N, 1)$

 $x = \lambda^{\mathbf{n}_f} \mathbf{y}, \qquad \lambda \to \lambda$

Pak, Smirnov 10; Semenova, A. Smirnov, V. Smirnov 18

Example

Additional Regulators/ Rapidity Divergences

MoR subdivides $\mathcal{N}(I) \to {\mathcal{N}(I^R)} \Longrightarrow$ new (internal) facets $F^{\text{int.}}$

New facets can introduce spurious singularities not regulated by dim reg

Lee Pomeransky Representation:

$$\mathcal{N}(I^{(R)}) = \bigcap_{f \in F} \left\{ \mathbf{m} \in \mathbb{R}^{N} \mid \langle \mathbf{m}, \mathbf{n}_{f} \rangle + a_{f} \ge 0 \right\}$$
$$I \sim \sum_{\sigma \in \Delta_{\mathcal{N}}^{T}} |\sigma| \int_{\mathbb{R}^{N}_{\geq 0}} \left[\mathrm{d}\mathbf{y}_{f} \right] \prod_{f \in \sigma} y_{f}^{\langle \mathbf{n}_{f}, \boldsymbol{\nu} \rangle + \frac{D}{2}a_{f}} \left(c_{i} \prod_{f \in \sigma} y_{f}^{\langle \mathbf{n}_{f}, \mathbf{r}_{i} \rangle + a_{f}} \right)^{-\frac{D}{2}}$$

If $f \in F^{\text{int}}$ have $a_f = 0$ need analytic regulators $\nu \to \nu + \delta \nu$ Heinrich, Jahn, SJ, Kerner, Langer, Magerya, Põldaru, Schlenk, Villa 21; Schlenk 16

Regions due to Cancellation

What happens if c_i have different signs?

Consider a 1-loop massive bubble at threshold $y = m^2 - q^2/4 \rightarrow 0$

$$\begin{array}{c} x_{1} \\ q \\ \rightarrow \end{array} \\ x_{2} \end{array} \qquad I = \Gamma(\epsilon) \int d\alpha_{1} d\alpha_{2} \frac{\delta(1 - \alpha_{1} - \alpha_{2})(\alpha_{1} + \alpha_{2})^{-2 + 2\epsilon}}{\left(\mathscr{F}_{\text{bub}}(\alpha_{1}, \alpha_{2}; q^{2}, y)\right)^{\epsilon}} \\ \mathscr{F}_{\text{bub}} = \frac{q^{2}}{4}(\alpha_{1} - \alpha_{2})^{2} + y(\alpha_{1} + \alpha_{2})^{2} \end{array}$$

Can split integral into two subdomains $\alpha_1 \leq \alpha_2$ and $\alpha_2 \leq \alpha_1$ then remap $\alpha_1 = \alpha'_1/2$ $\alpha_2 = \alpha'_2 + \alpha'_1/2$: $\mathscr{F}_{\text{bub},1} \rightarrow \frac{q^2}{4} \alpha'_2^2 + y(\alpha'_1 + \alpha'_2)^2$ (for first domain)

Jantzen, A. Smirnov, V. Smirnov 12

Before split: only **hard** region found $(\alpha_1 \sim y^0, \alpha_2 \sim y^0)$ After split: also **potential** region found $(\alpha_1 \sim y^0, \alpha_2 \sim y^{1/2})$

Regions due to Cancellation

Various tools attempt to find such re-mappings using **linear** changes of variables

ASY/FIESTA Jantzen, A. Smirnov, V. Smirnov 12

Check all pairs of variables (α_1, α_2) which are part of monomials of opposite sign

For each pair, try to build linear combination $\alpha_1 \to b\alpha'_1, \alpha_2 \to \alpha'_2 + b\alpha'_1$ s.t negative monomial vanishes

Repeat until all negative monomials vanish **or** warn user

ASPIRE Ananthanarayan, Pal, Ramanan, Sarkar 18; B. Ananthanarayan, Das, Sarkar 20

Consider Gröbner basis of $\{\mathcal{F}, \partial \mathcal{F}/\alpha_1, \partial \mathcal{F}/\alpha_2, ...\}$ (i.e. \mathcal{F} and Landau equations)

Eliminate negative monomials with linear transformations $\alpha_1 \rightarrow b\alpha'_1, \alpha_2 \rightarrow \alpha'_2 + b\alpha'_1$

This is not enough to straightforwardly expose all regions in parameter space

Integrals with Pinch Singularities

Landau Equations

Polynomials \mathcal{U}, \mathcal{F} can vanish (gives singularities) for some $\alpha_i \to 0$ (end-point)

Additionally, due to signs in \mathscr{F} it can vanish due to cancellation of terms Avoid poles on real axis by deforming contour (roughly speaking...):

$$\alpha_k \to \alpha_k - i\varepsilon_k(\boldsymbol{\alpha})$$
$$\mathcal{F}(\boldsymbol{\alpha}; \boldsymbol{s}) \to \mathcal{F}(\boldsymbol{\alpha}; \boldsymbol{s}) - i\sum_k \varepsilon_k \frac{\partial \mathcal{F}(\boldsymbol{\alpha}; \boldsymbol{s})}{\partial \alpha_k} + \mathcal{O}(\varepsilon^2)$$

If $\mathscr{F}(\boldsymbol{\alpha}; \mathbf{s}) = 0$ and $\partial \mathscr{F}(\boldsymbol{\alpha}; \mathbf{s}) / \partial \alpha_j = 0 \ \forall j$ simultaneously, contour will vanish exactly where the deformation is required, above conditions are just the Landau equations

Landau Equations (parameter space):

1)
$$\mathscr{F}(\boldsymbol{\alpha}; \mathbf{s}) = 0$$
 $(L+1)\mathscr{F} = \sum_{k=1}^{N} \alpha_k \frac{\partial \mathscr{F}}{\partial \alpha_k}$
2) $\alpha_j \frac{\partial \mathscr{F}(\boldsymbol{\alpha}; \mathbf{s})}{\partial \alpha_j} = 0 \quad \forall j$

Leading: $\alpha_j \neq 0 \forall j$

Solutions are *pinched surfaces* of the integral where IR divergences may arise

Looking for Trouble: Algorithm

Generally, solutions of the Landau equations depend on **s**. Let us restrict our search to solutions with *generic* kinematics

$$\mathcal{F} = -\sum_{i} s_{i} \left[f_{i}(\boldsymbol{\alpha}) - g_{i}(\boldsymbol{\alpha}) \right] = \sum_{i} \mathcal{F}_{i,-} + \mathcal{F}_{i,+}$$
$$\mathcal{F}_{i,-} = -s_{i} f_{i}(\boldsymbol{\alpha}), \quad \mathcal{F}_{i,+} = s_{i} g_{i}(\boldsymbol{\alpha}), \quad f_{i}(\boldsymbol{\alpha}), g_{i}(\boldsymbol{\alpha}) \ge 0$$

Algorithm (finds integrals which *potentially* have a pinch in the massless case) For each s_i :

1) Compute
$$\mathcal{F}_{i,-}, \mathcal{F}_{i,+}$$

2) If
$$\mathscr{F}_{i,-} = 0$$
 or $\mathscr{F}_{i,+} = 0 \rightarrow \text{Exit}$ (no cancellation)

3) If
$$\partial \mathcal{F}_{i,-}/\partial \alpha_j = 0$$
 or $\partial \mathcal{F}_{i,+}/\partial \alpha_j = 0$ set $\alpha_j = 0 \rightarrow \text{Goto 1}$

Else → Exit (potential cancellation)

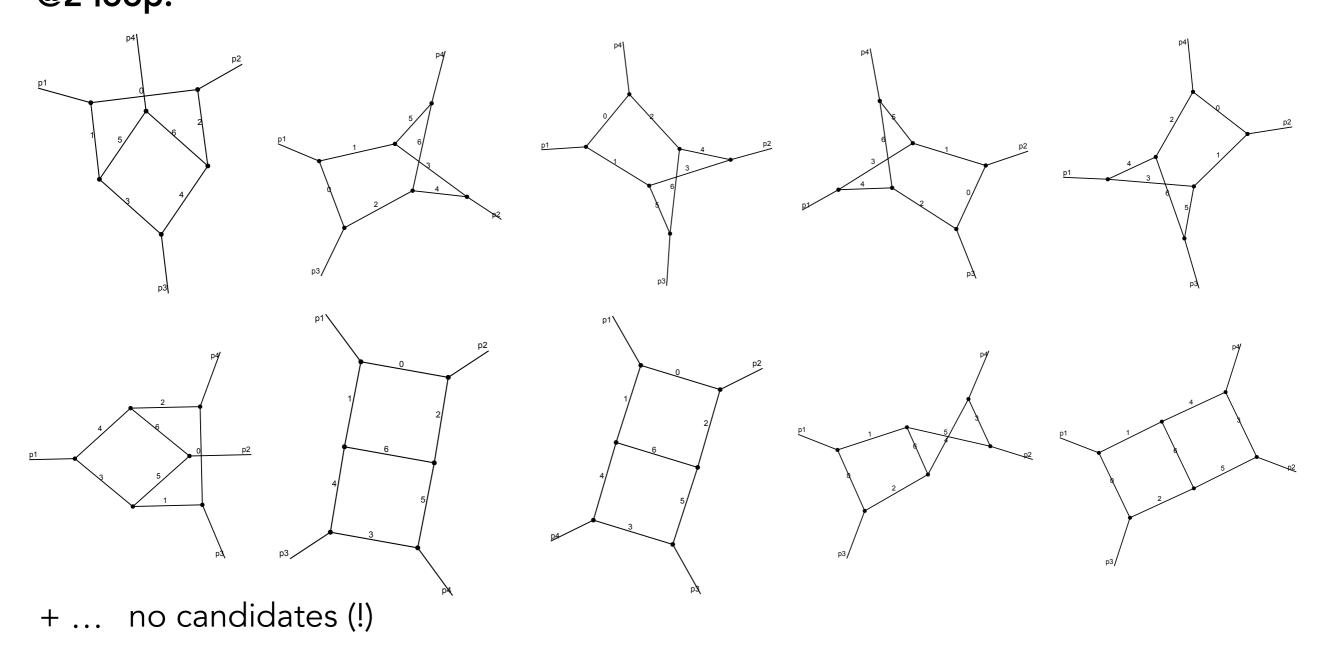

Much more sophisticated algorithms for solving Landau equations exist

(E.g.) Mizera, Simon Telen 21; Fevola, Mizera, Telen 23 (See also) Gambuti, Kosower, Novichkov, Tancredi 23

Looking for Trouble: 1- & 2-loops

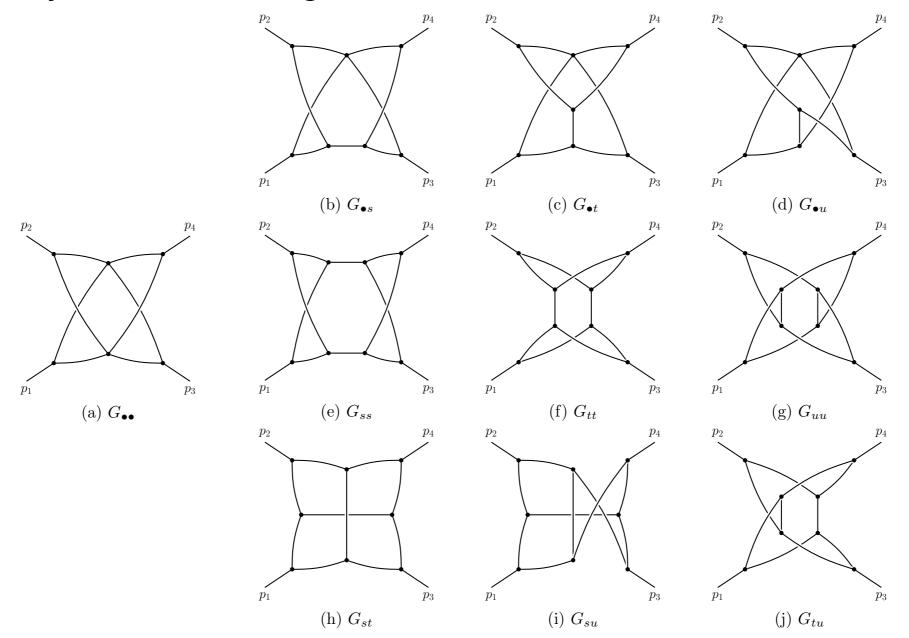

We considered massless 4-point scattering amplitudes ($s_{23} = -s_{12} - s_{13}$)

@1-loop: found no candidates (trivially)@2-loop:

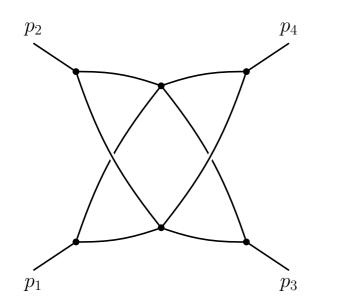

Looking for Trouble: 3-loops

@3-loop: finally some interesting candidates

The complete set of corresponding master integrals for generic s_{12} , s_{13} are known Henn, Mistlberger, Smirnov, Wasser 20; Bargiela, Caola, von Manteuffel, Tancredi 21;

Interesting Example

$$= \int_0^\infty \mathrm{d}x_0 \dots \mathrm{d}x_7 \frac{\mathcal{U}(\mathbf{x})^{4\epsilon}}{\mathcal{F}(\mathbf{x};\mathbf{s})^{2+3\epsilon}} \delta(1-x_7)$$

 $\mathcal{U}(\alpha) = \alpha_0 \alpha_2 \alpha_4 + \alpha_0 \alpha_2 \alpha_5 + \alpha_0 \alpha_2 \alpha_6 + (29 \text{ terms})$

$$\mathcal{F}(\boldsymbol{\alpha}; \mathbf{s}) = -s_{12} (\alpha_1 \alpha_4 - \alpha_0 \alpha_5) (\alpha_3 \alpha_6 - \alpha_2 \alpha_7) - s_{13} (\alpha_1 \alpha_2 - \alpha_0 \alpha_3) (\alpha_5 \alpha_6 - \alpha_4 \alpha_7),$$

$$\frac{\partial \mathcal{F}(\boldsymbol{\alpha}; \mathbf{s})}{\partial \alpha_0} = s_{12} \alpha_5 (\alpha_3 \alpha_6 - \alpha_2 \alpha_7) + s_{13} \alpha_3 (\alpha_5 \alpha_6 - \alpha_4 \alpha_7),$$

$$\vdots$$

$$\frac{\partial \mathcal{F}(\boldsymbol{\alpha}; \mathbf{s})}{\partial \alpha_7} = s_{12} \alpha_2 (\alpha_1 \alpha_4 - \alpha_0 \alpha_5) + s_{13} \alpha_4 (\alpha_1 \alpha_2 - \alpha_0 \alpha_3)$$

Can have a leading Landau singularity with generic kinematics (arbitrary s_{12}, s_{13}) when each factor of \mathcal{F} vanishes!

Interesting Example

Let's try to compute this with sector decomposition (pySecDec)

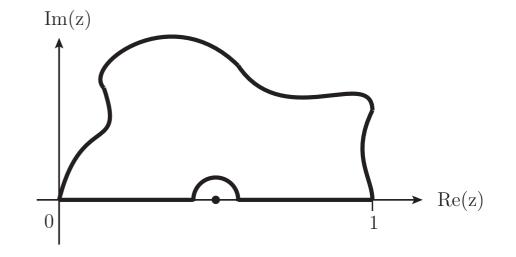

● ● ● ssh

Fails to find contour...

Contour Deformation

Feynman integral (after sector decomp):

$$I \sim \int_0^1 [\mathbf{d}\boldsymbol{\alpha}] \, \boldsymbol{\alpha}^{\nu} \, \frac{[\mathcal{U}(\boldsymbol{\alpha})]^{N-(L+1)D/2}}{[\mathcal{F}(\boldsymbol{\alpha};\mathbf{s})]^{N-LD/2}}$$

Deform integration contour to avoid poles on real axis Feynman prescription $\mathcal{F} \to \mathcal{F} - i\delta$ tells us how to do this

Expand
$$\mathscr{F}(\boldsymbol{z} = \boldsymbol{\alpha} - i\boldsymbol{\tau})$$
 around $\boldsymbol{\alpha}$, $\mathscr{F}(\boldsymbol{z}) = \mathscr{F}(\boldsymbol{\alpha}) - i\sum_{j} \tau_{j} \frac{\partial \mathscr{F}(\boldsymbol{\alpha})}{\partial \alpha_{j}} + \mathcal{O}(\tau^{2})$

Choose $\tau_j = \lambda_j \alpha_j (1 - \alpha_j) \frac{\partial \mathscr{F}(\boldsymbol{\alpha})}{\partial \alpha_j}$ with small constants $\lambda_j > 0$

Soper 99; Binoth, Guillet, Heinrich, Pilon, Schubert 05; Nagy, Soper 06; Anastasiou, Beerli, Daleo 07, 08; Beerli 08; Borowka, Carter, Heinrich 12; Borowka 14;...

Contour Deformation

But for this class of examples $\mathscr{F}(\boldsymbol{\alpha})$ and all $\partial \mathscr{F}(\boldsymbol{\alpha})/\partial \alpha_i$ vanish at the same point inside the integration domain

 \rightarrow pinch singularity

Example

$$\begin{aligned} \mathscr{F}(\boldsymbol{\alpha};\mathbf{s}) &= -s_{12} \left(\alpha_1 \alpha_4 - \alpha_0 \alpha_5 \right) \left(\alpha_3 \alpha_6 - \alpha_2 \alpha_7 \right) - s_{13} \left(\alpha_1 \alpha_2 - \alpha_0 \alpha_3 \right) \left(\alpha_5 \alpha_6 - \alpha_4 \alpha_7 \right), \\ \frac{\partial \mathscr{F}(\boldsymbol{\alpha};\mathbf{s})}{\partial \alpha_0} &= s_{12} \alpha_5 (\alpha_3 \alpha_6 - \alpha_2 \alpha_7) + s_{13} \alpha_3 (\alpha_5 \alpha_6 - \alpha_4 \alpha_7), \\ \vdots \\ \frac{\partial \mathscr{F}(\boldsymbol{\alpha};\mathbf{s})}{\partial \alpha_7} &= s_{12} \alpha_2 (\alpha_1 \alpha_4 - \alpha_0 \alpha_5) + s_{13} \alpha_4 (\alpha_1 \alpha_2 - \alpha_0 \alpha_3) \end{aligned}$$

vanish for

$$\alpha_2 = \frac{\alpha_0 \alpha_3}{\alpha_1}, \qquad \alpha_4 = \frac{\alpha_0 \alpha_5}{\alpha_1}, \qquad \alpha_6 = \frac{\alpha_0 \alpha_7}{\alpha_1}.$$

Resolution

The problem is that we have monomials with different signs...

Asy2.1 PreResolve->True

	-bash	て第1
MACTHXJONES:fiesta sj\$ Get["asy2.1.m"];	cat diagram2636.m	
(k1+k2+k3)^2, (k1+k2+k3	[{k1,k2,k3}, {k1^2, k2^2,k3^2, (k1+p1)^2, +p1+p2+p3)^2}, {p1^2->0, p2^2->0, p3^2->0 3/2}, {s12 -> 1, s13 -> -1/5}, PreResolve	, p1*p2->s12/2, p1*p3->
MACTHXJONES:fiesta sj\$ Diagram2636 Asy2.1 Variables for UF: {k1, WARNING: preresolution {}		
 MACTHXJONES:fiesta sj\$		

Correctly identifies that iterated linear changes of variables are not sufficient to resolve the singularity and reports that pre-resolution has failed

Resolution

1) Rescale parameters to *linearise* singular surfaces

$$\mathcal{F}(\boldsymbol{\alpha}; \mathbf{s}) = -s_{12} (\alpha_1 \alpha_4 - \alpha_0 \alpha_5) (\alpha_3 \alpha_6 - \alpha_2 \alpha_7) - s_{13} (\alpha_1 \alpha_2 - \alpha_0 \alpha_3) (\alpha_5 \alpha_6 - \alpha_4 \alpha_7)$$
$$\alpha_0 \to \alpha_0 \alpha_1, \ \alpha_2 \to \alpha_2 \alpha_3, \ \alpha_4 \to \alpha_4 \alpha_5, \ \alpha_6 \to \alpha_6 \alpha_7$$
$$\mathcal{F}(\boldsymbol{\alpha}; \mathbf{s}) = \alpha_1 \alpha_3 \alpha_5 \alpha_7 \left[-s_{12} (\alpha_4 - \alpha_0) (\alpha_6 - \alpha_2) - s_{13} (\alpha_2 - \alpha_0) (\alpha_6 - \alpha_4) \right]$$

2) Split the integral by imposing $\alpha_i \ge \alpha_j \ge \alpha_k \ge \alpha_l$

$$\begin{aligned} \alpha_0 &\to \alpha_0 + \alpha_2 + \alpha_4 + \alpha_6, \\ \alpha_2 &\to \alpha_2 + \alpha_4 + \alpha_6, \\ \alpha_4 &\to \alpha_4 + \alpha_6, \\ \alpha_6 &\to \alpha_6 \end{aligned} + perms$$

$$\mathcal{F}_{1}(\boldsymbol{\alpha}; \mathbf{s}) = \alpha_{1}\alpha_{3}\alpha_{5}\alpha_{7} \left[-s_{12}(\alpha_{0} + \alpha_{2})(\alpha_{2} + \alpha_{4}) - s_{13}(\alpha_{0})(\alpha_{4}) \right]$$

$$\mathcal{F}_{2}(\boldsymbol{\alpha}; \mathbf{s}) = \alpha_{1}\alpha_{3}\alpha_{5}\alpha_{7} \left[-s_{12}(\alpha_{2})(\alpha_{0} + \alpha_{2} + \alpha_{6}) + s_{13}(\alpha_{0})(\alpha_{6}) \right]$$

$$\vdots$$

$$\mathcal{F}_{24}(\boldsymbol{\alpha}; \mathbf{s}) = \alpha_{1}\alpha_{3}\alpha_{5}\alpha_{7} \left[-s_{12}(\alpha_{2} + \alpha_{4})(\alpha_{4} + \alpha_{6}) - s_{13}(\alpha_{2})(\alpha_{6}) \right]$$

All coefficients of s_{12}, s_{13} now have definite sign

Result

Can now obtain results numerically ($s_{12} = 1$, $s_{13} = -1/5$)

$$\begin{split} &I_1 = \epsilon^{-4} \left[(-3.8842800687 + 5.2359902003j) \pm (4.458 \cdot 10^{-6} + 3.638 \cdot 10^{-6}j) \right] + \dots \\ &I_2 = \epsilon^{-4} \left[(-7.9291803033 + 20.943767810j) \pm (9.149 \cdot 10^{-5} + 1.061 \cdot 10^{-4}j) \right] + \dots \\ &I_3 = \epsilon^{-4} \left[(18.5195704502 - 15.707988011j) \pm (5.897 \cdot 10^{-5} + 5.897 \cdot 10^{-5}j) \right] + \dots \\ &I_4 = \epsilon^{-4} \left[(-13.294034089) \pm (2.068 \cdot 10^{-5}) \right] + \dots \\ &I_5 = \epsilon^{-4} \left[(12.7432949988 - 23.561968275j) \pm (1.605 \cdot 10^{-5} + 1.415 \cdot 10^{-5}j) \right] + \dots \\ &I_6 = \epsilon^{-4} \left[(-4.0702330904) \pm (2.018 \cdot 10^{-6}) \right] + \dots \end{split}$$

Agrees with analytic result

$$I = 4 (I_1 + I_2 + I_3 + I_4 + I_5 + I_6)$$

= $e^{-4} [8.34055 - 52.3608j] + \mathcal{O}(e^{-3})$
 $I_{\text{analytic}} = e^{-4} [8.3400403922 - 52.3598775598j] + \mathcal{O}(e^{-3})$

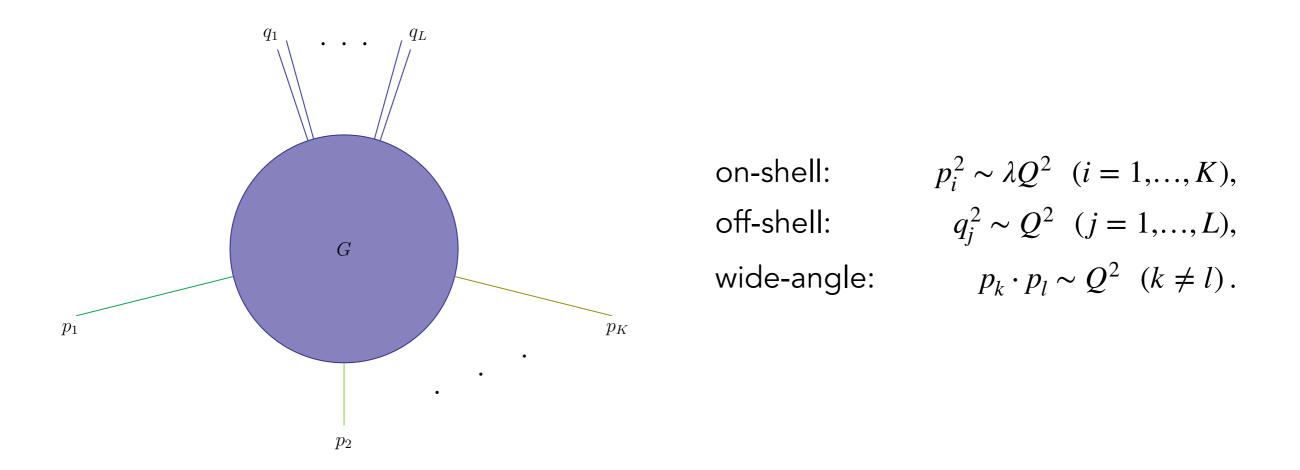

Note: even after resolution this integral is slow to compute numerically, possible to vastly improve performance by avoiding contour deformation entirely

 \rightarrow We will return to this point shortly

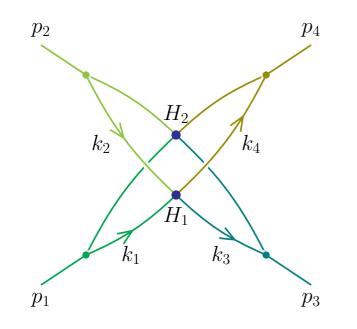

MoR and Hidden Regions

On-shell expansion provides a way to explore emergence of IR singularities starting from an object free of IR singularities (off-shell Green's function)

Consider an arbitrary loop, (K + L)-leg wide-angle scattering graph

Cancellations of the type just observed lead to new regions that are *hidden* in the straightforward Newton polytope approach as they do not originate from an end-point singularity

Consider a collinear/jet configuration $p_i^2 = \lambda Q^2$, $p_i \cdot v_i \sim \lambda Q$, $p_i \cdot \overline{v}_i \sim Q$, $p_i \cdot v_{i\perp} \sim \sqrt{\lambda} Q$

Let us introduce a fourth (extra) loop momentum and consider the mode with all k_i collinear to p_i

$$k_i^{\mu} = Q\left(\xi_i v_i^{\mu} + \lambda \kappa_i \overline{v}_i^{\mu} + \sqrt{\lambda} \tau_i u_i^{\mu} + \sqrt{\lambda} \nu_i n^{\mu}\right)$$

Botts, Sterman 89

Momentum conservation at H_1 vertex ($k_1 + k_2 = k_3 + k_4$) implies not all ξ_i are independent:

$$\begin{split} \xi_2 &= \xi_1 - \frac{1}{2}\sqrt{\lambda}\cos^2(\theta) \left(\tan\left(\frac{\theta}{2}\right)\Delta\tau - \cot\left(\frac{\theta}{2}\right)\Sigma\tau \right) + \lambda(\kappa_2 - \kappa_1), \\ \xi_3 &= \xi_1 + \frac{1}{2}\sqrt{\lambda}\tan\left(\frac{\theta}{2}\right)\Delta\tau + \lambda(\kappa_2 - \kappa_4), \\ \xi_4 &= \xi_1 - \frac{1}{2}\sqrt{\lambda}\cot\left(\frac{\theta}{2}\right)\Sigma\tau + \lambda(\kappa_2 - \kappa_3). \end{split} \qquad \qquad \Delta\tau \equiv \tau_1 + \tau_2 - \tau_3 - \tau_4 \\ \Sigma\tau &= \tau_1 + \tau_2 + \tau_3 + \tau_4 \end{split}$$

Now let us analyse the leading behaviour of this integrand for small λ ,

- 1) Loop measure can be expressed as $\int d^D k_1 d^D k_2 d^D k_3 = Q^{3D} \int \prod_{i=1}^3 d\xi_i d\kappa_i d\tau_i d\nu_i$
- 2) Trade large components of k_2, k_3 for small components of $k_4, \{\xi_2, \xi_3\} \rightarrow \{\kappa_4, \tau_4\}$ Jacobian of transformation: det $\left(\frac{\partial(\xi_2, \xi_3)}{\partial(\kappa_4, \tau_4)}\right) = \lambda^{3/2} \cos(\theta) \cot(\theta)$

Overall obtain the following scaling:

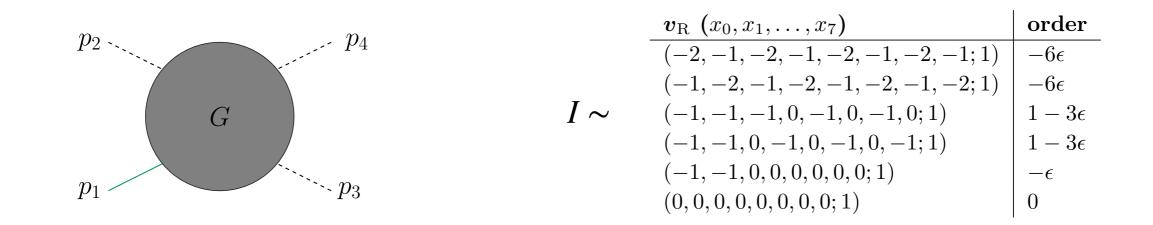

$$\int \prod_{i=1}^{3} d\xi_{i} d\kappa_{i} d\tau_{i} d\nu_{i} \sim \int_{0}^{1} d\xi_{1} \underbrace{\left(\int \prod_{i=1}^{3} (\lambda d\kappa_{i})(\lambda^{\frac{1}{2}} d\tau_{i})(\lambda^{\frac{1}{2}} d\nu_{i})^{1-2\epsilon}\right)}_{\lambda^{6-3\epsilon}} \int d\kappa_{4} d\tau_{4} \underbrace{\det\left(\frac{\partial(\xi_{2},\xi_{3})}{\partial(\kappa_{4},\tau_{4})}\right)}_{\lambda^{3/2}}$$

Expect this region to scale as
$$\mu = 6 - 3\epsilon + \frac{3}{2} - \frac{8}{2} = -\frac{1}{2} - 3\epsilon$$

Scaling of collinear propagators

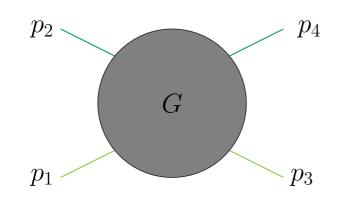

Directly applying MoR in parameter space, we do not see this region...

 $I_1 \sim$

Dissecting the polytope according to our resolution procedure eliminates monomials of different sign, we now see the region in each of the 24 new polytopes

Forward Scattering

Inserting $\theta \sim \sqrt{\lambda}$ into the Botts-Sterman analysis leads to one of the loop momenta becoming Glauber:

$$k_4^{\mu} - k_2^{\mu} = k_1^{\mu} - k_3^{\mu} \sim Q(\lambda, \lambda; \sqrt{\lambda})$$

We obtain $\mu = -1 - 3\epsilon$

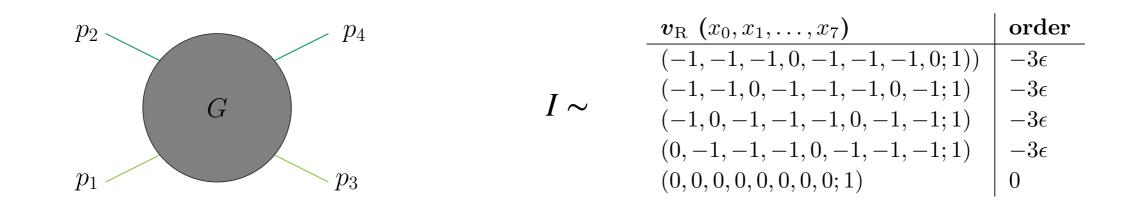

Alternatively, can expand known analytic result in the foward limit $x = -s_{13}/s_{12}$ Henn, Mistlberger, Smirnov, Wasser 20; Bargiela, Caola, von Manteuffel, Tancredi 21;

$$\begin{split} I(s_{12}, s_{13}; \epsilon) &= s_{12}^{-2-3\epsilon} \mathcal{F}(x; \epsilon), \quad \mathcal{F}(x; \epsilon) \sum_{n=-4}^{\infty} \mathcal{F}^{(n)}(x) \, \epsilon^n = \sum_{n=-4}^{\infty} \sum_{k=-1}^{\infty} \mathcal{F}^{(n,k)}(L) \, x^k \, \epsilon^n \, \blacktriangleleft L = \log(x) \\ \mathcal{F}(x; \epsilon) &= \mathrm{LP}\left\{I_{\mathrm{XX}}\right\}(L; \epsilon) + \mathcal{O}(x^0) \\ \mathrm{LP}\left\{\mathcal{F}\right\}(L; \epsilon) &= i\pi x^{-1-3\epsilon} \left(-\frac{8}{3\epsilon^4} + \frac{16}{\epsilon^3} + \frac{2\left(\pi^2 - 144\right)}{3\epsilon^2} - \frac{4\left(-58\zeta(3) + 3\pi^2 - 432\right)}{3\epsilon} + \frac{1}{60}\left(-27840\zeta(3) + 71\pi^4 + 1440\pi^2 - 207360\right) + \cdots\right), \end{split}$$

gives $\mathscr{I}(x;\epsilon) \sim x^{-1-3\epsilon}$

Forward Scattering

Directly applying MoR in parameter space, no region with correct scaling...

After resolution, in some polytopes we now directly see the leading region observed in the analytic result!

	$\boldsymbol{v}_{\mathrm{R}}~(y_{0}, x_{1}, y_{2}, x_{3}, y_{4}, x_{5}, y_{6}, x_{7})$	$\boldsymbol{v}_{\mathrm{R}}$ (x_0, x_1, \ldots, x_7)	order

Avoiding Contour Deformation in the Minkowski Regime

Minkowski Regime

Several conflicting definitions of the term *Minkowski regime* for Feynman Integrals

In the remainder of this talk I will use the following conventions:

(Pseudo-)Euclidean

 $\mathscr{F}(\boldsymbol{\alpha}) \geq 0$ for $\boldsymbol{\alpha} \in \mathbb{R}^{N}_{\geq 0}$

Minkowski

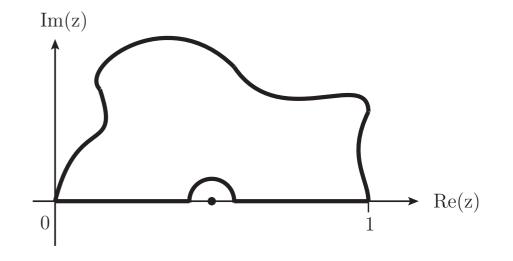

Not Euclidean/Pseudo-Euclidean

We can have $\mathscr{F}(\boldsymbol{\alpha}) < 0$ for some values of $\boldsymbol{\alpha} \in \mathbb{R}^{N}_{\geq 0}$

Contour Deformation

Feynman integral (after integrating δ -func.):

$$I \sim \int_0^1 [\mathbf{d}\boldsymbol{\alpha}] \, \boldsymbol{\alpha}^{\nu} \, \frac{[\mathcal{U}(\boldsymbol{\alpha})]^{N-(L+1)D/2}}{[\mathcal{F}(\boldsymbol{\alpha};\mathbf{s})]^{N-LD/2}}$$

Deform our integration contour to avoid poles on real axis Feynman prescription $\mathcal{F} \to \mathcal{F} - i\delta$ tells us how to do this

Expand
$$\mathscr{F}(\boldsymbol{z} = \boldsymbol{\alpha} - i\boldsymbol{\tau})$$
 around $\boldsymbol{\alpha}$, $\mathscr{F}(\boldsymbol{z}) = \mathscr{F}(\boldsymbol{\alpha}) - i\sum_{j} \tau_{j} \frac{\partial \mathscr{F}(\boldsymbol{\alpha})}{\partial \alpha_{j}} + \mathcal{O}(\tau^{2})$
Choose $\tau_{j} = \lambda_{j} \alpha_{j} (1 - \alpha_{j}) \frac{\partial \mathscr{F}(\boldsymbol{\alpha})}{\partial \alpha_{j}}$ with small constants $\lambda_{j} > 0$

Soper 99; Binoth, Guillet, Heinrich, Pilon, Schubert 05; Nagy, Soper 06; Anastasiou, Beerli, Daleo 07, 08; Beerli 08; Borowka, Carter, Heinrich 12; Borowka 14;...

Can also generalise $\lambda_j \rightarrow \lambda_j(\boldsymbol{\alpha})$ and train the deformation with a Neural Network Winterhalder, Magerya, Villa, SJ, Kerner, Butter, Heinrich, Plehn 22

Contour Deformation

Downsides of contour deformation:

- 1. Real valued integrand \rightarrow complex valued integrand (slower numerics)
- 2. Large and complicated Jacobian from $\mathbf{x} \rightarrow \mathbf{z}$ (can be optimised)
 - Borinsky, Munch, Tellander 23
- 3. Increases variance of function (integrand can be both > 0 and < 0)
- 4. Sensitive to choice of contour
- 5. Sometimes fails analytically and/or numerically

Summary: it is **slow, arbitrary** and can **fail**

Can we find a way to avoid contour deformation? Yes

Always? I don't know*

NoCD: Avoiding Contour Deformation

Idea:

1. Construct transformations of the Feynman parameters which map the zeroes of the \mathcal{F} -polynomial to the boundary of integration

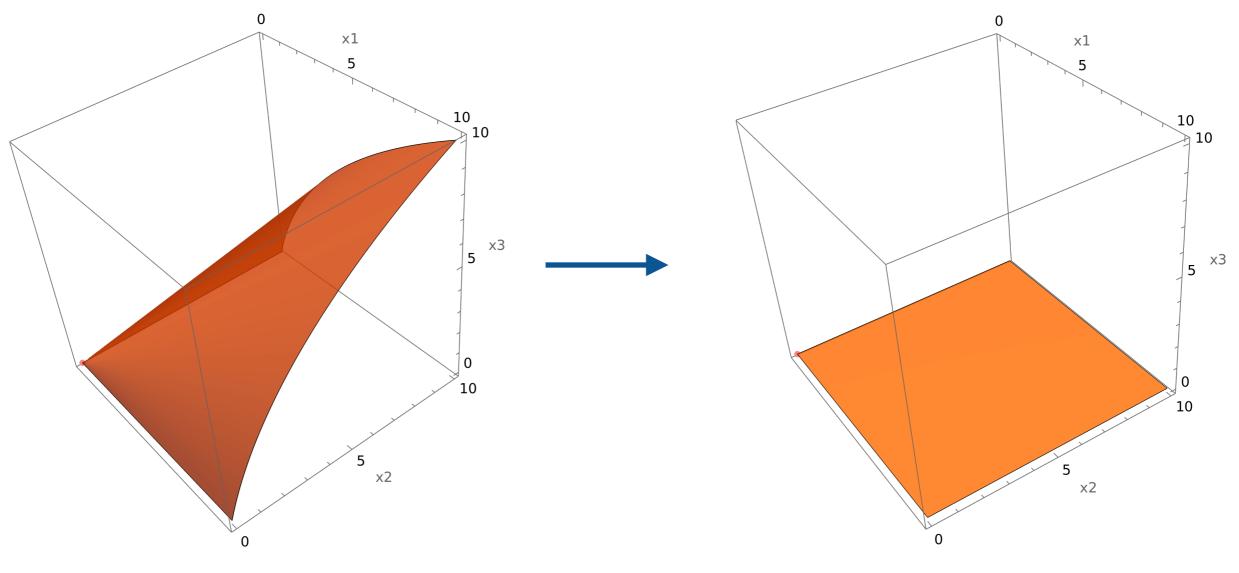

Figure: Thomas Stone

NoCD: Avoiding Contour Deformation

Idea:

2. For transformations which make \mathscr{F} non-positive extract an overall minus sign (using the $i\delta$ prescription to generate the physically correct imaginary part)

3. Stitch together the resulting integrals

$$I = \sum_{n_{+}=1}^{N_{+}} I_{n_{+}}^{+} + (-1 - i\delta)^{-(\nu - LD/2)} \sum_{n_{-}=1}^{N_{-}} I_{n_{-}}^{-}$$

The individual integrals $\{I_{n_+}^+, I_{n_-}^-\}$ have manifestly non-negative integrands \implies no contour deformation, trivial analytic continuation, faster to integrate

NoCD: Avoiding Contour Deformation

Rules of the Game:

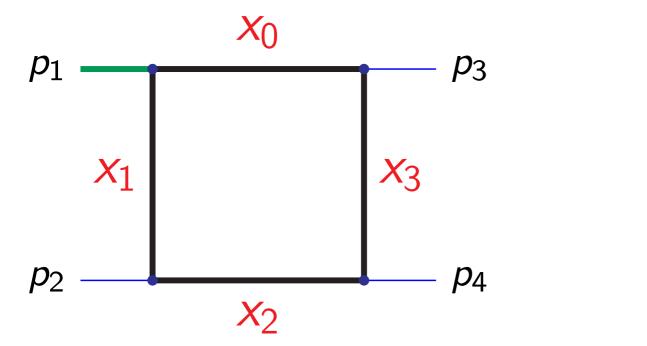

1. Transformations must not spoil the δ -func. constraint Cheng-Wu Theorem:

$$\forall S \subseteq \{1, \dots, N\} \land S \neq \emptyset : \qquad \delta \left(1 - \sum_{j=1}^{N} \alpha_j\right) \to \delta \left(1 - \sum_{j \in S} \alpha_j\right)$$

- 2. Transformations must preserve the sign of $\mathcal{U} \geq 0$
- 3. Jacobian $\mathcal J$ of the transformation must have a definite sign

We found the following transformations useful:

- 1. Rescaling: $\alpha_j \rightarrow c\alpha_j$ with c > 0
- 2. Blow-up: $\alpha_j \to \alpha_i \alpha_j$ $1 = \theta(\alpha_a \alpha_b) + \theta(\alpha_b \alpha_a)$
- 3. Decomposition: $x_j \rightarrow x_i + x_j$

•
$$\mathcal{U} = x_0 + x_1 + x_2 + x_3$$

• $\mathcal{F} = -sx_0x_2 - tx_1x_3 - p_1^2x_0x_1$

Let's consider the regime: s > 0, $p_1^2 > 0$ & $t < 0 \Rightarrow$ zeroes of \mathcal{F} within the integration volume for $\{x_0, x_1, x_2, x_3\} \in \mathbb{R}^4_{>0}$

Slide: Thomas Stone (Loops & Legs 2024) Convention: *x* is now a Feynman parameter

Generate $\mathscr{U}_1^+, \mathscr{U}_1^-, \mathscr{U}_2^-$ by applying the same transformations to \mathscr{U} Compute the Jacobian determinants of the transformations $\mathscr{J}_1^+, \mathscr{J}_1^-, \mathscr{J}_2^-$

Each new integral is of the form:

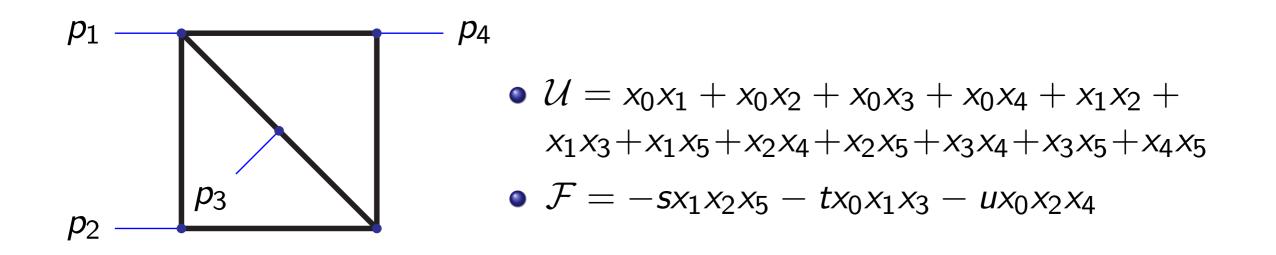

$$I_{n_{\pm}}^{\pm} \sim \mathcal{J}_{n_{\pm}}^{\pm} \left(\mathcal{U}_{n_{\pm}}^{\pm} \right)^{2\varepsilon} \left(\mathcal{F}_{n_{\pm}}^{\pm} \right)^{-2-\varepsilon}$$

with manifestly non-negative integrand

We have converted the initial integral into sum of 3 integrals:

$$I = I_1^+ + (-1 - i\delta)^{-2 - \varepsilon} (I_1^- + I_2^-)$$

Verified result numerically against known analytic result

Momentum conservation implies $s + t + u = 0 \Rightarrow u = -(s + t)$ Hence, \mathcal{F} can be 0 within $\{x_i\} \in \mathbb{R}^6_{>0}$ even with s > 0, t > 0Not possible to define a Euclidean region at all! Nevertheless, the method works

We considered the cases:

- 1. s > -t
- 2. s < -t

We obtain *different* resolutions for each case

Nevertheless, in each case we find we need 6 integrals to cover the space:

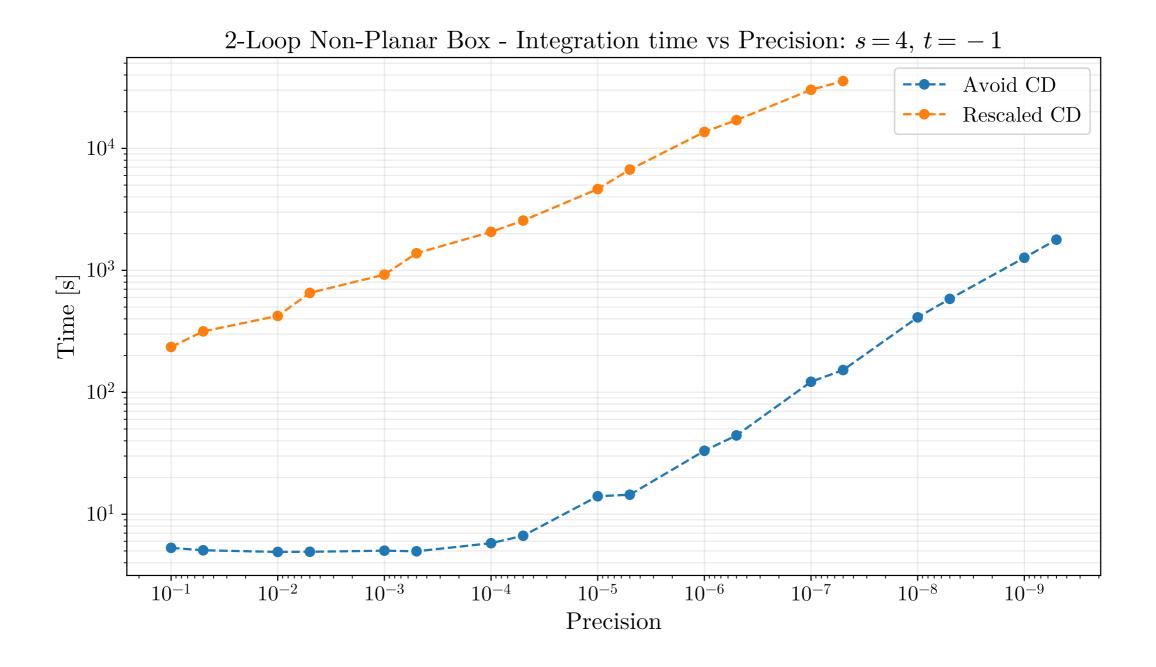

$$I = \left(I_1^+ + I_2^+ + I_3^+\right) + \left(-1 - i\delta\right)^{-2 - 2\varepsilon} \left(I_1^- + I_2^- + I_3^-\right)$$

Verified result numerically against known analytic result Tausk 99

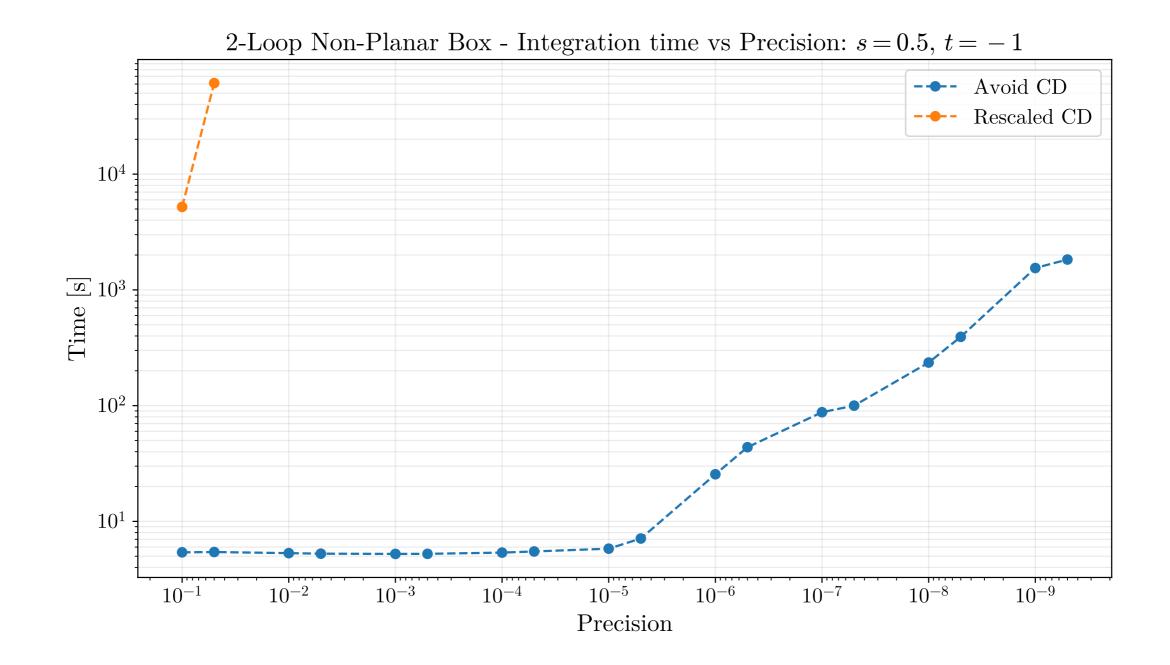

Let's take a look at the time taken to numerically integrate this example...

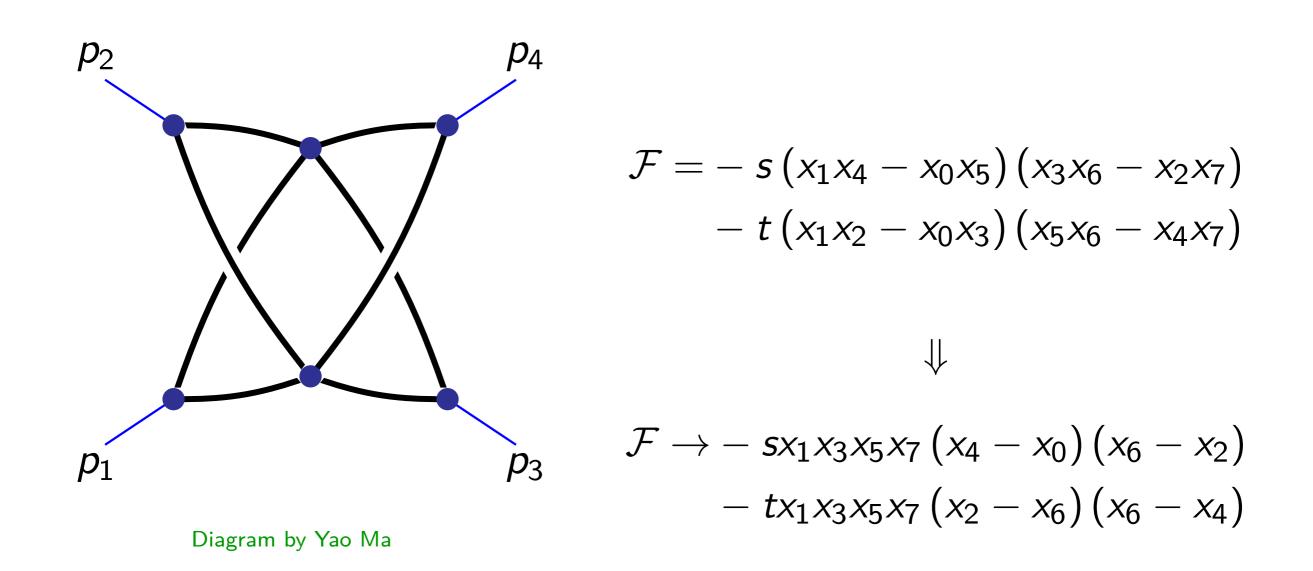

Evaluating up-to-and-including finite order with pySecDec

Heinrich, SPJ, Kerner, Magerya, Olsson, Schlenk 23

Evaluating up-to-and-including finite order with pySecDec

For s > -t > 0, two of the 6 independent integrals require contour deformation:

$$\mathcal{F}_{3} = x_{1}x_{3}x_{5}x_{7} \left[-sx_{0}x_{2} + |t| \left(x_{0} + x_{4} \right) \left(x_{2} + x_{4} \right) \right]$$
$$\mathcal{F}_{5} = x_{1}x_{3}x_{5}x_{7} \left[sx_{6} \left(x_{0} + x_{2} + x_{6} \right) - |t| \left(x_{0} + x_{6} \right) \left(x_{2} + x_{6} \right) \right]$$

Can express each of these in terms of 4 manifestly non-negative integrands

Putting the pieces together for the full integral:

$$I = \sum_{n_{+}=1}^{8} I_{n_{+}}^{+} + (-1 - i\delta)^{-2 - 3\varepsilon} \sum_{n_{-}=1}^{4} I_{n_{-}}^{-}$$

Verified result numerically against known analytic result

Henn, Mistlberger, Smirnov, Wasser 20; Bargiela, Caola, von Manteuffel, Tancredi 21

Can now obtain results numerically ($s_{12} = 1, s_{13} = -1/5$)

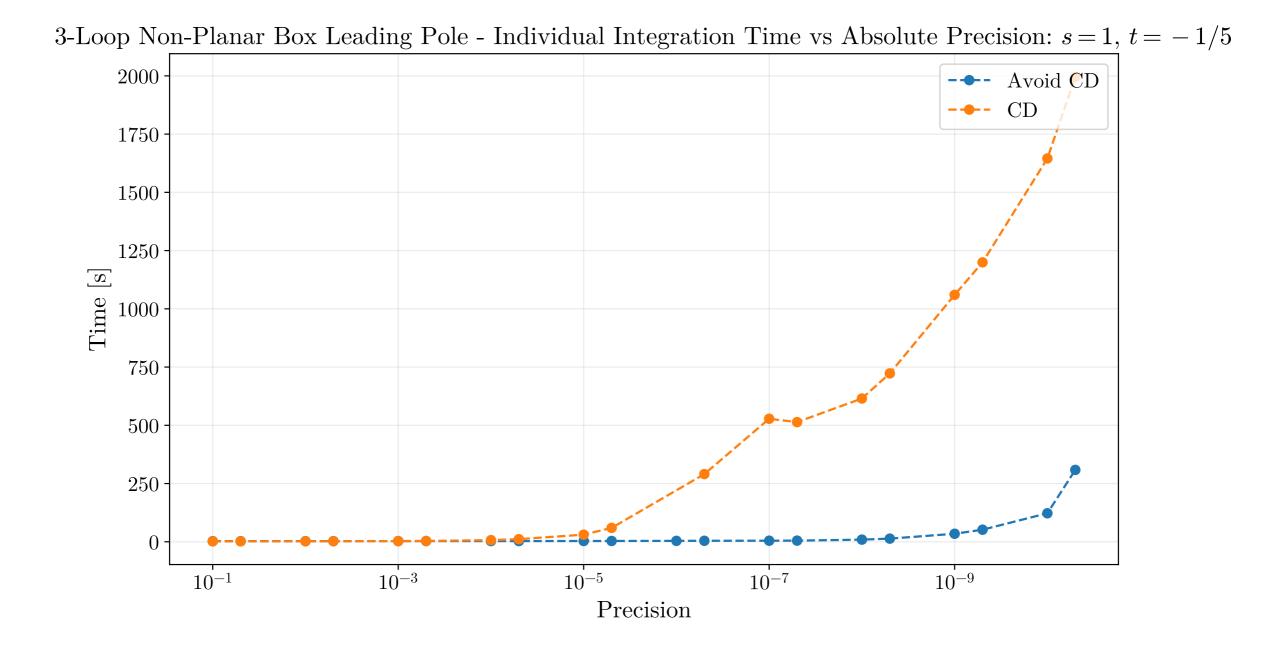

$$\begin{split} I_3 &= \epsilon^{-4} \left[(18.5195704502 - 15.707988011i) \pm (5.897 \cdot 10^{-5} + 5.897 \cdot 10^{-5}i) \right] + \dots \\ I_3^{\text{NoCD}} &= \epsilon^{-4} \left[(18.51948920208488 - 15.70796326794897i) \pm (4.032 \cdot 10^{-11} + 4.592 \cdot 10^{-11}i) \right] + \dots \\ I_5 &= \epsilon^{-4} \left[(12.7432949988 - 23.561968275i) \pm (1.605 \cdot 10^{-5} + 1.415 \cdot 10^{-5}i) \right] + \dots \\ I_5^{\text{NoCD}} &= \epsilon^{-4} \left[(12.74326269721394 - 23.5619449018131i) \pm (4.125 \cdot 10^{-11} + 6.919 \cdot 10^{-11}i) \right] + \dots \end{split}$$

Full result after a few minutes integration with pySecDec:

$$I = \epsilon^{-4} \left[8.34055 - 52.3608i \right] + \mathcal{O} \left(\epsilon^{-3} \right)$$
$$I^{\text{NoCD}} = \epsilon^{-4} \left[8.340040392028 - 52.3598775598347i \right] + \mathcal{O} \left(\epsilon^{-3} \right)$$
$$I^{\text{analytic}} = \epsilon^{-4} \left[8.34004039223768 - 52.35987755984493i \right] + \mathcal{O} \left(\epsilon^{-3} \right)$$

Numerics are much, much faster and more stable

Evaluating leading pole with pySecDec

NoCD: Massive Integrals

Can this work also for massive integrals?

$$\mathcal{F}(\boldsymbol{x};\boldsymbol{s}) = \mathcal{F}_0(\boldsymbol{x};\boldsymbol{s}) + \mathcal{U}_0(\boldsymbol{x})\sum_{j=1}^N m_j^2 x_j$$

Now x_i appears quadratically in \mathcal{F}

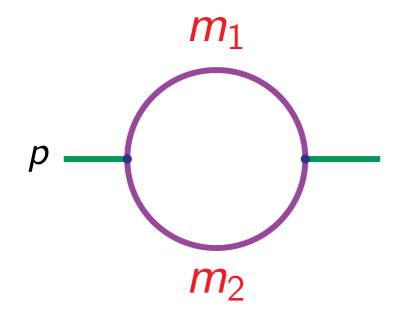

Transformations harder to find, even for trivial integrals

Ideas:

- 1. Can geometry guide us in the right direction?
- 2. Is this just singularity resolution? If so, how can we use existing technology?

Hironaka

e.g. desing

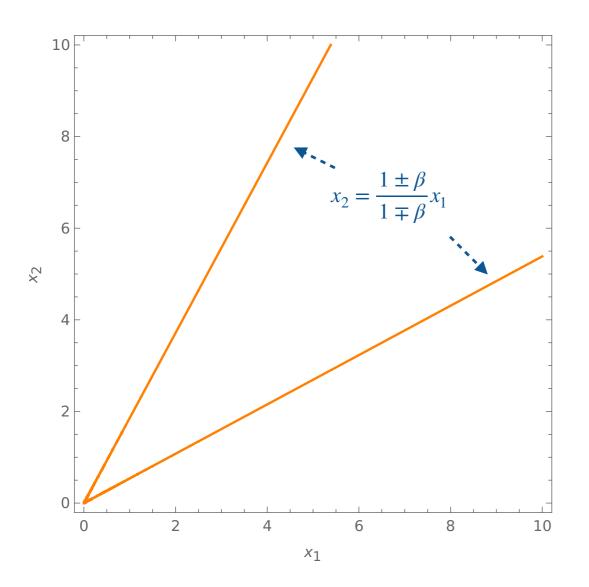

•
$$\mathcal{F} = -p^2 x_1 x_2 + (x_1 + x_2) \left(\frac{m_1^2 x_1 + m_2^2 x_2}{m_1^2 x_1 + m_2^2 x_2} \right)$$

• Define $\beta^2 := \frac{p^2 - (m_1 + m_2)^2}{p^2 - (m_1 - m_2)^2} \in [0, 1)$

• Scale out dimension of \mathcal{F} via $x_i \rightarrow \frac{x_i}{m_i}$

$$\mathcal{F}
ightarrow \widetilde{\mathcal{F}} = x_1^2 + x_2^2 - 2rac{1+eta^2}{1-eta^2}x_1x_2$$

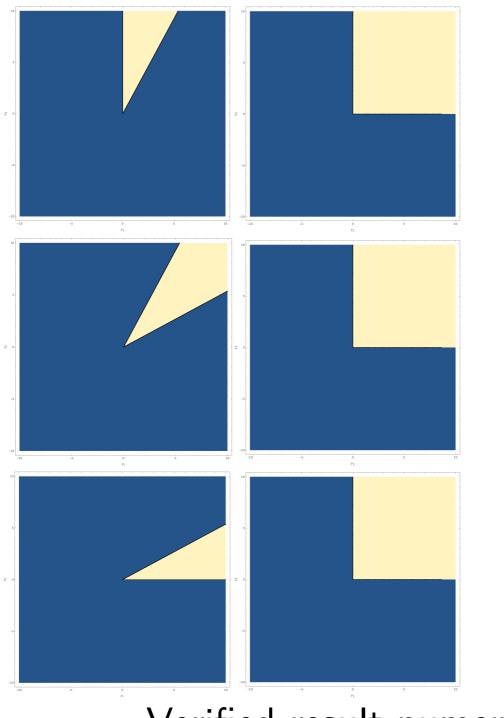

- Let's consider the variety of $\widetilde{\mathcal{F}}$
- 3 regions \Rightarrow 3 integrals
- 2 positive regions, 1 negative region

Massive Bubble

$$I = I_1^+ + I_2^+ + (-1 - i\delta)^{-\varepsilon} I_1^-$$

 Construct transformations which directly send the variety to the integration boundary

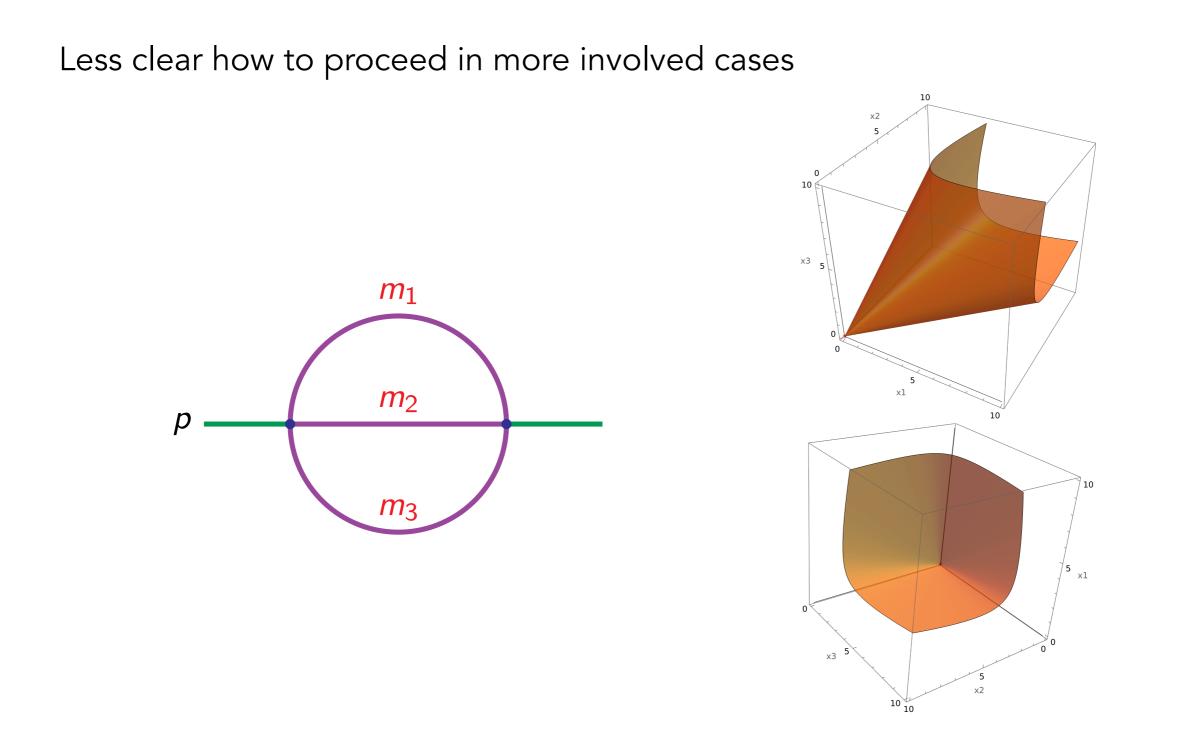

$$\widetilde{\mathcal{F}}_1^+ = y_2 \left(y_2 + \frac{4\beta}{1-\beta^2} y_1 \right)$$

$$\widetilde{\mathcal{F}}_1^- = rac{4\beta}{1-\beta^2} y_1 y_2$$

$$\widetilde{\mathcal{F}}_2^+ = rac{y_1\left(4eta y_2 + (1+eta)^2 y_1
ight)}{1-eta^2}$$

Verified result numerically & analytically \checkmark

Very happy to try smart ideas you have... or see arguments why this wont work

Conclusion

Pinched Feynman Integrals

- Studied an integral with a *pinched* contour independent of kinematics
- Found a resolution procedure to remove the pinch
- Can obtain stable numerical results only after removing pinch

MoR

• Expect regions can appear due to cancelling monomials either generically or at particular kinematic points

NoCD

- Presented method for evaluating integrals in the Minkowski regime without contour deformation
- Demonstrated procedure for some 1,2,3-loop massless & 1-loop massive integrals

Outlook

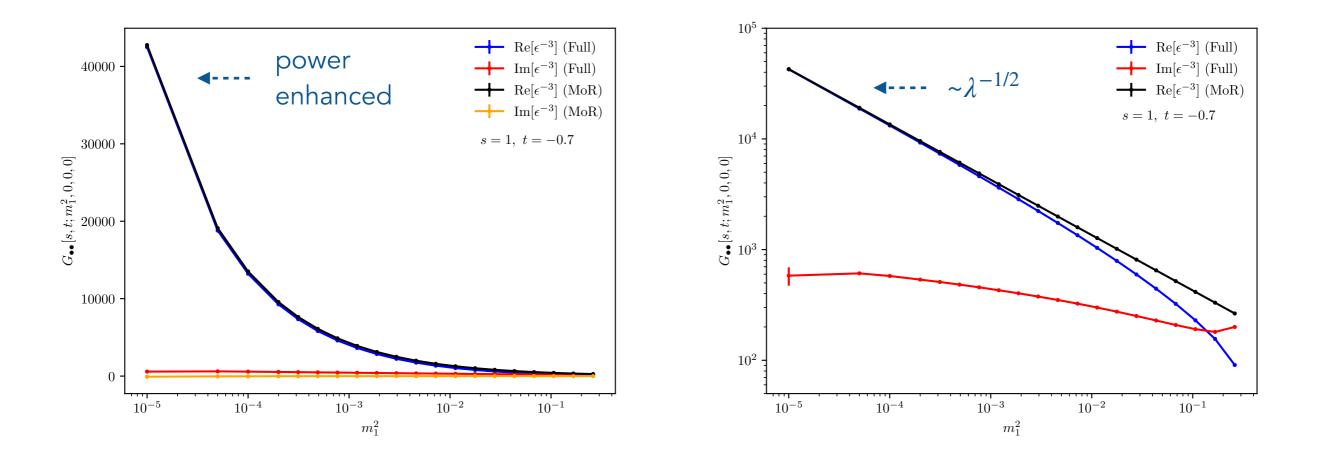

• General/automated procedure to resolve pinches and/or zeros of \mathcal{F} ?

Thank you for listening!

Backup

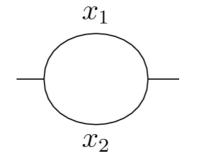

On-Shell Expansion

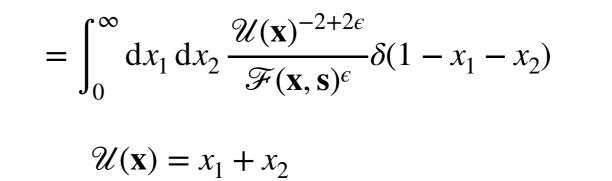

Use MoR on each of the split integrals $I_1, ..., I_{24}$ and summing only the leading region for each split (with $\mu = -1/2 - 3\epsilon$)

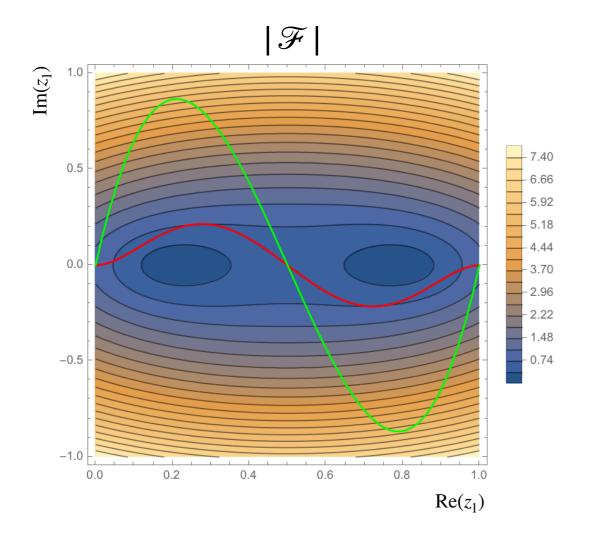

See strong numerical evidence that the split integrals (MoR) reproduce the leading behaviour of the full integral in the limit $p_1^2 \rightarrow 0$

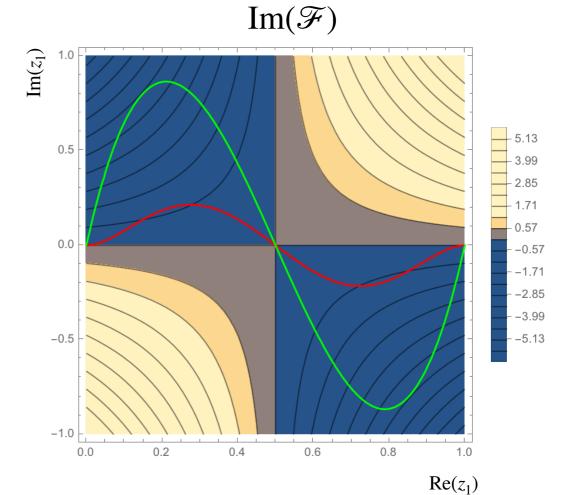

Contour Deformation

$$\mathcal{F}(\mathbf{x}, \mathbf{s}) = -sx_1x_2 + (m_1^2x_1 + m_2^2x_2)(x_1 + x_2)$$

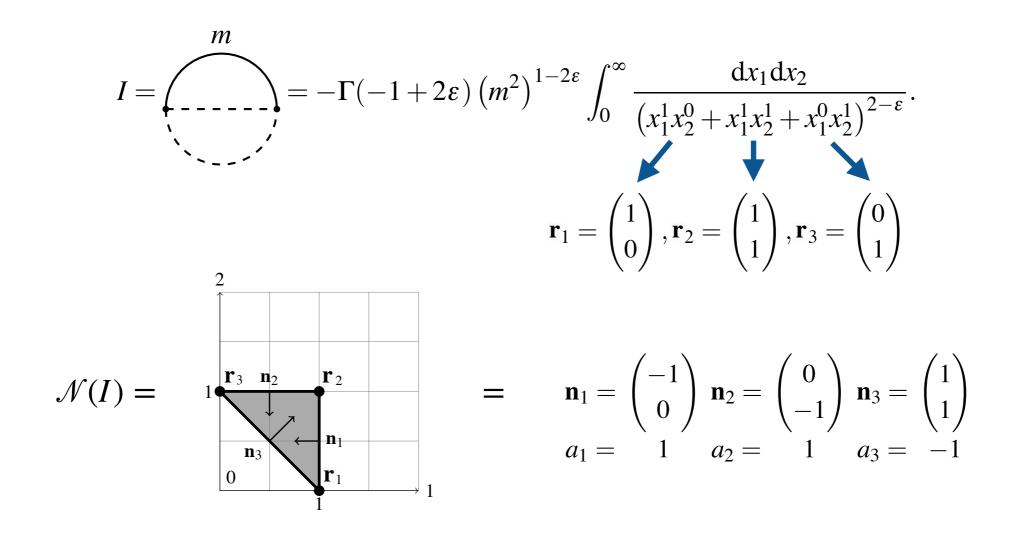

57

Sector Decomposition

Sector Decomposition in a Nutshell

For each vertex make the local change of variables

e.g.
$$\mathbf{r}_1: x_1 = y_1^{-1}y_3^1, x_2 = y_1^0y_3^1, \mathbf{r}_2: x_1 = y_1^{-1}y_2^0, x_2 = y_1^0y_2^{-1}, \mathbf{r}_3: x_1 = y_2^0y_3^1, x_2 = y_2^{-1}y_3^1$$

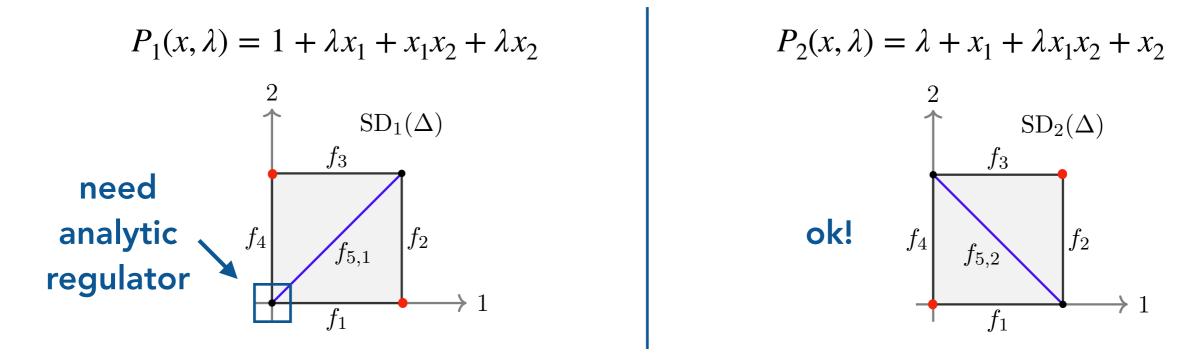

$$I = -\Gamma(-1+2\varepsilon) (m^2)^{1-2\varepsilon} \int_0^1 dy_1 dy_2 dy_3 \frac{y_1^{-\varepsilon} y_2^{-\varepsilon} y_3^{-1+\varepsilon}}{(y_1+y_2+y_3)^{2-\varepsilon}} [\delta(1-y_2) + \delta(1-y_3) + \delta(1-y_1)]$$

Schlenk 2016

Applications

Additional Regulators (II)

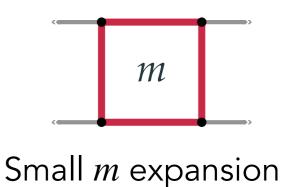

Toy Example:

pySecDec can find the constraints on the analytic regulators for you

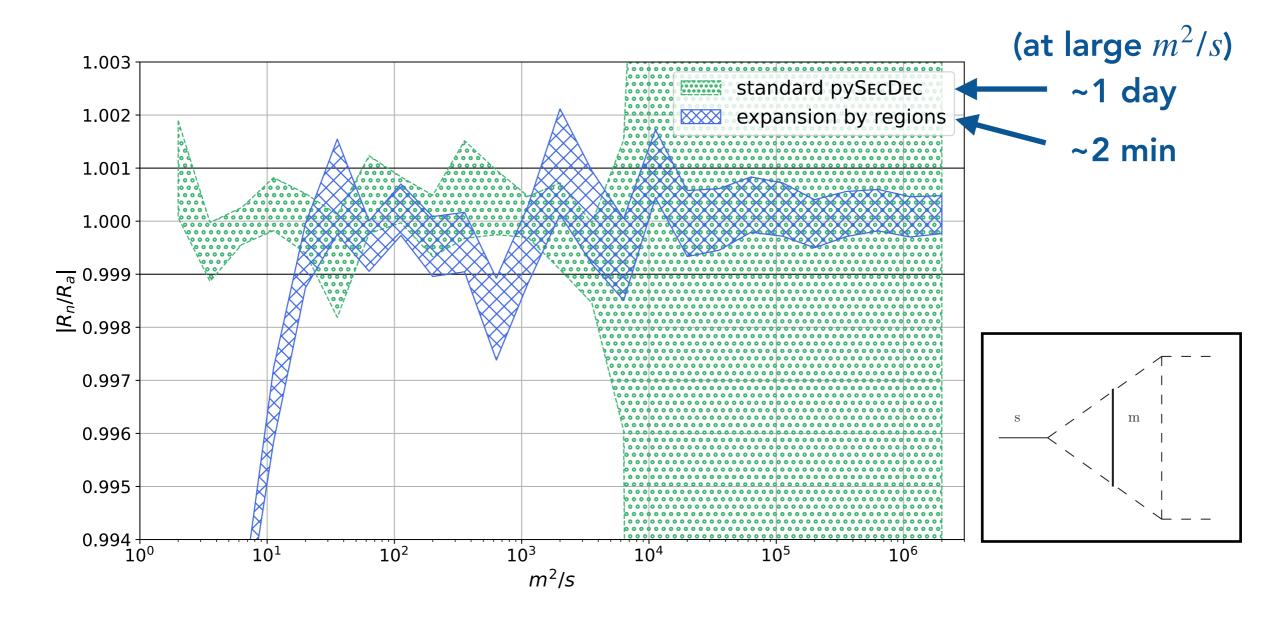

extra_regulator_constraints(): $v_2 - v_4 \neq 0, v_1 - v_3 \neq 0$

suggested_extra_regulator_exponent(): $\{\delta\nu_1, \delta\nu_2, \delta\nu_3, \delta\nu_4\} = \{0, 0, \eta, -\eta\}$

Applying Expansion by Regions

Ratio of the finite $\mathcal{O}(\epsilon^0)$ piece of numerical result R_n to the analytic result R_a

For large ratio of scales (m^2/s) the EBR result is **faster** & **easier** to integrate

Lee-Pomeransky and MoR

Building Bridges: LP ↔ Propagator Scaling

Region vectors in momentum space and Lee-Pomeransky space are related, we can see this using Schwinger parameters \tilde{x}_e

$$\frac{1}{D_n^{\nu_e}} = \frac{1}{\Gamma(\nu_e)} \int_0^\infty \frac{\mathrm{d}\tilde{x}_e}{\tilde{x}_e} \ \tilde{x}_e^{\nu_e} \ e^{-\tilde{x}_e D_e} \text{ , with } x_e \propto \tilde{x}_e$$

$$(D_1^{-1}, \dots, D_N^{-1}) \sim (\tilde{x}_1, \dots, \tilde{x}_N) \sim (x_1, \dots, x_N)$$

Example: 1-loop form factor

Hard :
$$(D_1^{-1}, D_2^{-1}, D_3^{-1}) \sim (\lambda^0, \lambda^0, \lambda^0),$$
 $(x_1, x_2, x_3) \sim (\lambda^0, \lambda^0, \lambda^0)$
Collinear to p_1 : $(D_1^{-1}, D_2^{-1}, D_3^{-1}) \sim (\lambda^{-1}, \lambda^0, \lambda^{-1}),$ $(x_1, x_2, x_3) \sim (\lambda^{-1}, \lambda^0, \lambda^{-1})$
Collinear to p_2 : $(D_1^{-1}, D_2^{-1}, D_3^{-1}) \sim (\lambda^0, \lambda^{-1}, \lambda^{-1}),$ $(x_1, x_2, x_3) \sim (\lambda^0, \lambda^{-1}, \lambda^{-1})$
Soft : $(D_1^{-1}, D_2^{-1}, D_3^{-1}) \sim (\lambda^{-1}, \lambda^{-1}, \lambda^{-2}),$ $(x_1, x_2, x_3) \sim (\lambda^{-1}, \lambda^{-1}, \lambda^{-2})$

Can connect the regions in mom. space with those we determine geometrically

Next step: automatically find (Sudakov decomposed) loop momentum scalings compatible with region vectors WIP w/ Yannick Ulrich

Building Bridges: Landau ↔ Regions

The Landau equations give the necessary conditions for an integral to diverge

1)
$$\alpha_e l_e^2(k, p, q) = 0$$
 $\forall e \in G$
2) $\frac{\partial}{\partial k_a^{\mu}} \mathscr{D}(k, p, q; \alpha) = \frac{\partial}{\partial k_a^{\mu}} \sum_{e \in G} \alpha_e \left(-l_e^2(k, p, q) - i\varepsilon \right) = 0$ $\forall a \in \{1, \dots, L\}$

Solutions are *pinched surfaces* of the integral where IR divergences may arise

Idea is to explore the neighbourhood of a pinched surface, defined by

1)
$$\alpha_e l_e^2(k, p, q) \sim \lambda^p \quad \forall e \in G, \text{ with } p \in \{1, 2\}$$

2) $\frac{\partial}{\partial k_a^{\mu}} \mathscr{D}(k, p, q; \alpha) \lesssim \lambda^{1/2} \quad \forall a \in \{1, \dots, L\}$

with the goal of further understanding the connection between

Solutions of the Landau equations \leftrightarrow Regions

Gardi, Herzog, Ma, Schlenk 22

Method of Regions (Details/Examples)

In Feynman parameter space, there is a **geometric method** for finding regions Pak, Smirnov 10

Each region will be defined by a **region vector** $\mathbf{v} = (v_1, ..., v_N; 1)$, in each region we will perform a change of variables $x_i \rightarrow \lambda^{v_i} x_i$ and series expand about $\lambda = 0$

Let us start by considering some polynomial

$$P(\mathbf{x}, \lambda) = \sum_{i=1}^{m} c_i x_1^{r_{i,1}} \cdots x_N^{r_{i,N}} \lambda^{r_{i,N+1}}$$

 c_i - non-negative coefficients

 x_i - integration variables

 λ - small parameter

 $\mathbf{r}_i = (r_{i,1}, \dots, r_{i,N+1}) \in \mathbb{N}^{N+1}$ - exponent vectors

Ignoring, for now, the coefficients c_i we can introduce a simple but useful picture for such polynomials:

- For each variable x_i or λ draw an orthogonal axis
- For each monomial, draw a dot at position \mathbf{r}_i

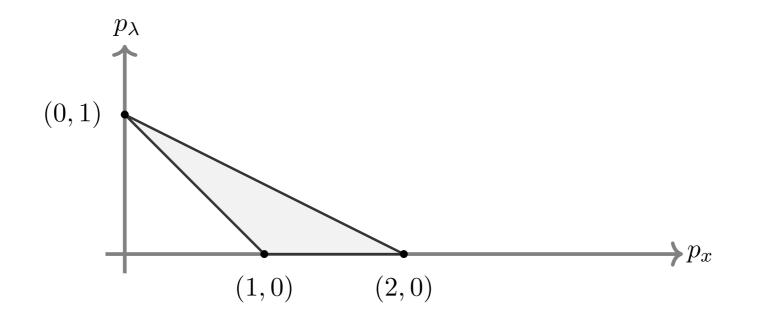

Example: $P(x, \lambda) = \lambda + x + x^2$ has exponent vectors $\mathbf{r}_1 = (0, 1), \mathbf{r}_2 = (1, 0), \mathbf{r}_3 = (2, 0)$

We may define a **Newton polytope** of the polynomial, this is the convex hull of the exponent vectors:

$$\Delta = \text{convHull}(\mathbf{r}_1, \mathbf{r}_2, \ldots) = \left\{ \sum_j \alpha_j \mathbf{r}_j \, | \, \alpha_j \ge 0 \land \sum_j \alpha_j = 1 \right\}$$

Example: $P(x, \lambda) = \lambda + x + x^2$ has exponent vectors $\mathbf{r}_1 = (0,1), \mathbf{r}_2 = (1,0), \mathbf{r}_3 = (2,0)$

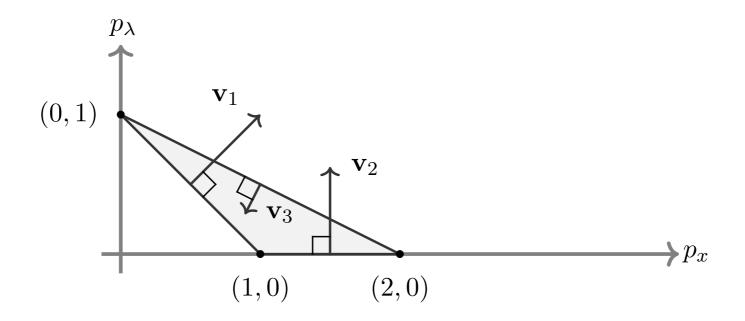

Alternatively, this polytope can also be described as the intersection of half spaces:

$$\Delta = \bigcap_{f \in F} \left\{ \mathbf{m} \in \mathbb{R}^{N+1} \mid \langle \mathbf{m}, \mathbf{v}_f \rangle + a_f \ge 0 \right\}$$

F - set of polytope facets, $a_{\!f} \in \mathbb{Z}$

 \mathbf{v}_{f} - inward-pointing normal vectors for each facet (co-dimension 1 face)

Several public tools exist for computing Newton polytopes/convex hulls and their representation in terms of facets exist, e.g. **Normaliz** and **Qhull**

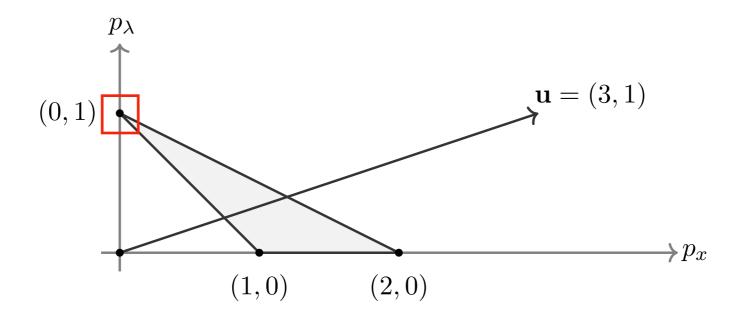

Next, let us define a vector **u** such that $x_i = \lambda^{u_i}$ with $u_{N+1} = 1$ for each point **x** in the integration domain, we can write:

$$P(\mathbf{u},\lambda) = \sum_{i=1}^{m} c_i \lambda^{\langle \mathbf{r}_i,\mathbf{u} \rangle}$$

Since $\lambda \ll 1$, the largest term in the polynomial has the smallest $\langle \mathbf{r}_i, \mathbf{u} \rangle$ Note that we can have several points with the same projection on \mathbf{u} , i.e. we can have several largest terms

Example:
$$P(x, \lambda) = \lambda + x + x^2$$
 with $\mathbf{u} = (3, 1)$ gives $P(\mathbf{u}, \lambda) = \lambda + \lambda^3 + \lambda^6$

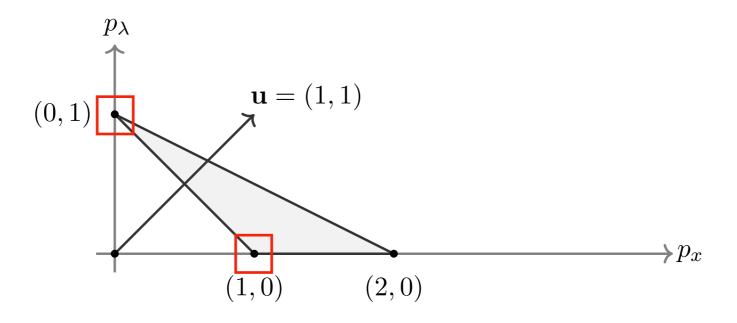

Next, let us define a vector **u** such that $x_i = \lambda^{u_i}$ with $u_{N+1} = 1$ for each point **x** in the integration domain, we can write:

$$P(\mathbf{u},\lambda) = \sum_{i=1}^{m} c_i \lambda^{\langle \mathbf{r}_i,\mathbf{u} \rangle}$$

Since $\lambda \ll 1$, the largest term in the polynomial has the smallest $\langle \mathbf{r}_i, \mathbf{u} \rangle$ Note that we can have several points with the same projection on \mathbf{u} , i.e. we can have several largest terms

Example:
$$P(x, \lambda) = \lambda + x + x^2$$
 with $\mathbf{u} = (1, 1)$ gives $P(\mathbf{u}, \lambda) = \lambda + \lambda + \lambda^2$

Expanding Regions

Rewrite our polynomial as: $P(\mathbf{x}) = Q(\mathbf{x}) + R(\mathbf{x})$

With $Q(\mathbf{x})$ defined such that it contains all of the lowest order terms in λ

The binomial expansion of $P(\mathbf{x})^m = Q(\mathbf{x})^m \left(1 + \frac{R(\mathbf{x})}{Q(\mathbf{x})}\right)^m \text{ converges for } \mathbf{x} = \lambda^{\mathbf{u}} \text{ if } R(\mathbf{x})/Q(\mathbf{x}) < 1$

Some observations:

- An expansion with region vector **v** converges at a point **u** if the terms with minimum $\langle \mathbf{r}_i, \mathbf{u} \rangle$ are contained in the terms with minimum $\langle \mathbf{r}_i, \mathbf{v} \rangle$
- For any **u** the vertices with the smallest $< \mathbf{r}_i, \mathbf{u} >$ must be part of some facet F
- Since u_{N+1} > 0, the lowest order terms for any u must lie on a facet whose inwards pointing normal vector has a positive (N + 1)-th component, let us call the set of such facets F⁺ or lower facets

Claim: regions are defined by vectors normal to the facets in F^+ , the integrand in each region consists of the monomials lying on the facet

Scaleless Integrals

Scaleless integrals seem to play quite an interesting role

Momentum space

In dimensional regularisation, scaleless integrals are 0

 $I(\{k_i\}_a, \{ck_i\}_b) = c^q I(\{k_i\}) \implies I(\{k_i\}) = 0, \quad \{k_i\} = \{k_i\}_a \cup \{k_i\}_b$

Where $c \neq 1$ and $q \neq 0$ is some scaling dimension

Feynman parameter space

 $(\mathscr{UF})(c^{\mathbf{u}}\mathbf{x}) = c^{q}(\mathscr{UF})(\mathbf{x}), \quad \mathbf{u} \neq n\mathbf{1}, \quad n \in \mathbb{R}$

Geometrical view

For Δ built from $\mathcal{U}+\mathcal{F}$

 $dim(\Delta) = dim(\mathbf{x}) \iff I \text{ scaleful}$ $dim(\Delta) < dim(\mathbf{x}) \iff I \text{ scaleless}$

Important consequences:

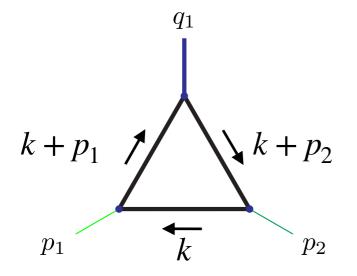

Faces of co-dimension > 1 are scaleless

"Region" vectors not normal to a facet give scaleless integrals

Overlap contributions i.e. rescaling by two region vectors, are scaleless

Triangle Example

Consider the on-shell limit $p_1^2 \sim p_2^2 \sim \lambda q_1^2$ for $\lambda \to 0$

$$\begin{split} I &= i\pi^{D/2} \mu^{4-D} \int \mathrm{d}^D k \frac{1}{(k+p_1)^2 (k+p_2)^2 (k^2)} \\ p_1 &= (p_1^+, p_1^-, p_1^\perp) \sim Q(\lambda, 1, \lambda^{\frac{1}{2}}) \\ p_2 &\sim Q(1, \lambda, \lambda^{\frac{1}{2}}) \end{split}$$

1) Split integrand up into regions

2) Series expand each region in λ

Hard : $k_{H}^{\mu} \sim (1,1,1) Q$ Collinear to p_{1} : $k_{J_{1}}^{\mu} \sim (\lambda,1,\lambda^{\frac{1}{2}}) Q$ Collinear to p_{2} : $k_{J_{2}}^{\mu} \sim (1,\lambda,\lambda^{\frac{1}{2}}) Q$ Soft : $k_{S}^{\mu} \sim (\lambda,\lambda,\lambda) Q$

$$I_{H} = i\pi^{d/2} \mu^{4-D} \int d^{D}k \frac{1}{(k^{2} + 2k^{+} \cdot p_{1}^{-})(k^{2} + 2k^{-} \cdot p_{2}^{+})(k^{2})}$$

$$I_{C_{1}} = i\pi^{d/2} \mu^{4-D} \int d^{D}k \frac{1}{(k+p_{1})^{2}(2k^{-} \cdot p_{2}^{+})(k^{2})}$$

$$I_{C_{2}} = i\pi^{d/2} \mu^{4-D} \int d^{D}k \frac{1}{(2k^{-} \cdot p_{1}^{+})(k+p_{2})^{2}(k^{2})}$$

$$I_{S} = i\pi^{d/2} \mu^{4-D} \int d^{D}k \frac{1}{(2k^{+} \cdot p_{1}^{-} + p_{1}^{2})(2k^{-} \cdot p_{2}^{+} + p_{2}^{2})(k^{2})}$$

Analysis follows: Becher, Broggio, Ferroglia 14

Triangle Example

3-5) Integrate each expansion over the whole integration domain, discard scaleless, sum

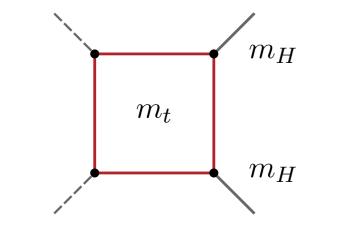

$$\begin{split} \mathbf{I}_{H} &= \frac{\Gamma(1+\epsilon)}{Q^{2}} \left(\frac{1}{\epsilon^{2}} + \frac{1}{\epsilon} \ln \frac{\mu^{2}}{Q^{2}} + \frac{1}{2} \ln^{2} \frac{\mu^{2}}{Q^{2}} - \frac{\pi^{2}}{6} + \mathcal{O}(\lambda) \right) \\ \mathbf{I}_{C_{1}} &= \frac{\Gamma(1+\epsilon)}{Q^{2}} \left(-\frac{1}{\epsilon^{2}} - \frac{1}{\epsilon} \ln \frac{\mu^{2}}{P_{1}^{2}} - \frac{1}{2} \ln^{2} \frac{\mu^{2}}{P_{1}^{2}} + \frac{\pi^{2}}{6} + \mathcal{O}(\lambda) \right) \\ \mathbf{I}_{C_{2}} &= \frac{\Gamma(1+\epsilon)}{Q^{2}} \left(-\frac{1}{\epsilon^{2}} - \frac{1}{\epsilon} \ln \frac{\mu^{2}}{P_{2}^{2}} - \frac{1}{2} \ln^{2} \frac{\mu^{2}}{P_{2}^{2}} + \frac{\pi^{2}}{6} + \mathcal{O}(\lambda) \right) \\ \mathbf{I}_{S} &= \frac{\Gamma(1+\epsilon)}{Q^{2}} \left(\frac{1}{\epsilon^{2}} + \frac{1}{\epsilon} \ln \frac{\mu^{2}Q^{2}}{P_{2}^{2}P_{1}^{2}} + \frac{1}{2} \ln^{2} \frac{\mu^{2}Q^{2}}{P_{2}^{2}P_{1}^{2}} + \frac{\pi^{2}}{6} + \mathcal{O}(\lambda) \right) \\ \mathbf{I} &= \mathbf{I}_{H} + \mathbf{I}_{C_{1}} + \mathbf{I}_{C_{2}} + \mathbf{I}_{S} = \frac{1}{Q^{2}} \left(\ln \frac{Q^{2}}{P_{2}^{2}} \ln \frac{Q^{2}}{P_{1}^{2}} + \frac{\pi^{2}}{3} + \mathcal{O}(\lambda) \right) \end{split}$$

This reproduces the expected result, but why does this work (and does it always)?

- 1) How did we find all the regions?
- 2) Did we not **double-count** when integrating over the whole domain ?

pySecDec: EBR Box Example

Example: 1-loop massive box expanded for small $m_t^2 \ll s$, |t|

Requires the use of analytic regulators Can regulate spurious singularities by adjusting

propagators powers

$$G_4 = \mu^{2\epsilon} \int_{-\infty}^{\infty} \frac{d^D k}{i\pi^{D/2}} \frac{1}{[k^2 - m_t^2]^{\delta_1} [(k+p_1)^2 - m_t^2]^{\delta_2} [(k+p_1+p_2)^2 - m_t^2]^{\delta_3} [(k-p_4)^2 - m_t^2]^{\delta_4}}$$

Can keep $\delta_1, \ldots, \delta_4$ symbolic or $\delta_1 = 1 + n_1/2, \delta_2 = 1 + n_1/3, \ldots$ and take $n_1 \to 0^+$

Output region vectors: $\mathbf{v}_1 = (0,0,0,0,1)$ $\mathbf{v}_2 = (-1, -1,0,0,1)$ $\mathbf{v}_3 = (0,0, -1, -1,1)$ $\mathbf{v}_4 = (-1,0,0, -1,1)$ $\mathbf{v}_5 = (0, -1, -1,0,1)$ **Result:** $s = 4.0, t = -2.82843, m_t^2 = 0.1, m_h^2 = 0$) $I = -1.30718 \pm 2.7 \cdot 10^{-6} + (1.85618 \pm 3.0 \cdot 10^{-6}) i$ $+ \mathcal{O}\left(\epsilon, n_1, \frac{m_t^2}{s}, \frac{m_t^2}{t}\right)$

Transform the expression for the full integral:

$$F = \int_{k \in D_{h}} Dk I + \int_{k \in D_{s}} Dk I = \sum_{i} \int_{k \in D_{h}} Dk T_{i}^{(h)} I + \sum_{j} \int_{k \in D_{s}} Dk T_{j}^{(s)} I$$

$$= \sum_{i} \left(\int_{k \in \mathbb{R}^{d}} Dk T_{i}^{(h)} I - \sum_{j} \int_{k \in D_{s}} Dk T_{j}^{(s)} T_{i}^{(h)} I \right) + \sum_{j} \left(\int_{k \in \mathbb{R}^{d}} Dk T_{j}^{(s)} I - \sum_{i} \int_{k \in D_{h}} Dk T_{i}^{(h)} T_{j}^{(s)} I \right)$$
The expansions commute:

$$T_{i}^{(h)} T_{j}^{(s)} I = T_{j}^{(s)} T_{i}^{(h)} I \equiv T_{i,j}^{(h,s)} I$$

$$\Rightarrow \text{ Identity: } F = \sum_{i} \int_{i} Dk T_{i}^{(h)} I + \sum_{j} \int_{i} Dk T_{j}^{(s)} I - \sum_{i,j} \int_{i} Dk T_{i,j}^{(h,s)} I$$

All terms are integrated over the whole integration domain \mathbb{R}^d as prescribed for the expansion by regions \Rightarrow location of boundary Λ between D_h, D_s is irrelevant.

Slide from: Bernd Jantzen, High Precision for Hard Processes (HP2) 2012

The general formalism (details)

Identities as in the examples are generally valid, under some conditions.

Consider

- a (multiple) integral $F = \int Dk I$ over the domain D (e.g. $D = \mathbb{R}^d$),
- a set of N regions $R = \{x_1, \ldots, x_N\}$,
- for each region $x \in R$ an expansion $T^{(x)} = \sum_j T_j^{(x)}$ which converges absolutely in the domain $D_x \subset D$.

Conditions

- $\bigcup_{x \in R} D_x = D$ $[D_x \cap D_{x'} = \emptyset \ \forall x \neq x'].$
- Some of the expansions commute with each other. Let $R_c = \{x_1, \ldots, x_{N_c}\}$ and $R_{nc} = \{x_{N_c+1}, \ldots, x_N\}$ with $1 \le N_c \le N$. Then: $T^{(x)}T^{(x')} = T^{(x')}T^{(x)} \equiv T^{(x,x')} \ \forall x \in R_c, \ x' \in R$.
- Every pair of non-commuting expansions is invariant under some expansion from R_c : $\forall x'_1, x'_2 \in R_{nc}, x'_1 \neq x'_2, \exists x \in R_c : T^{(x)}T^{(x'_2)}T^{(x'_1)} = T^{(x'_2)}T^{(x'_1)}$.
- ∃ regularization for singularities, e.g. dimensional (+ analytic) regularization.
 → All expanded integrals and series expansions in the formalism are well-defined.

Slide from: Bernd Jantzen, High Precision for Hard Processes (HP2) 2012

Bernd Jantzen, Expansion by regions: foundation, generalization and automated search for regions35The general formalism (2)Under these conditions, the following identity holds: $[F^{(x,...)} \equiv \sum_{j,...} \int Dk T_{j,...}^{(x,...)} I]$ $F = \sum_{x \in R} F^{(x)} - \sum_{\{x'_1, x'_2\} \subset R} F^{(x'_1, x'_2)} + \ldots - (-1)^n \sum_{\{x'_1, \ldots, x'_n\} \subset R} F^{(x'_1, \ldots, x'_n)} + \ldots + (-1)^{N_c} \sum_{x' \in R_{nc}} F^{(x', x_1, \ldots, x_{N_c})}$

where the sums run over subsets $\{x'_1, \ldots\}$ containing at most one region from R_{nc} .

Comments

- This identity is exact when the expansions are summed to all orders. ✓
 Leading-order approximation for F → dropping higher-order terms.
- It is independent of the regularization (dim. reg., analytic reg., cut-off, infinitesimal masses/off-shellness, ...) as long as all individual terms are well-defined.
- Usually regions & regularization are chosen such that multiple expansions
 F^(x'_1,...,x'_n) (n ≥ 2) are scaleless and vanish.
 [✓ if each F^(x)₀ is a homogeneous function of the expansion parameter with unique scaling.]
- If $\exists F^{(x'_1, x'_2, ...)} \neq 0 \rightsquigarrow$ relevant overlap contributions (\rightarrow "zero-bin subtractions"). They appear e.g. when avoiding analytic regularization in SCET. Chiu, Fuhrer, Hoang, Kelley, Manohar '09; ...

Slide from: Bernd Jantzen, High Precision for Hard Processes (HP2) 2012
